(54) Title: WATER-SOLUBLE STRONTIUM SALTS FOR USE IN TREATMENT OF CARTILAGE AND/OR BONE CONDITIONS

(57) Abstract: Compounds and pharmaceutical compositions for use in the treatment and/or prophylaxis of cartilage and/or bone conditions and for methods of treating such condition. The compounds are salts of strontium that have a water-solubility of from about 1g/l to about 100g/l at room temperature, especially amino acid salts of strontium or dicarboxylic acid salts of strontium. Examples of novel water-soluble strontium salts are e.g. strontium glutamate and strontium alpha-ketoglutarate. The present invention also relates to an improved method for preparing the strontium salt of glutamic acid.

**Water-soluble strontium salts for use in treatment of cartilage and/or bone conditions**

**Field of the Invention**

- 5 The present invention relates to compounds and pharmaceutical compositions for use in the treatment and/or prophylaxis of cartilage and/or bone conditions and for methods of treating such conditions. The compounds are salts of strontium that have a water-solubility of from about 1 g/l to about 100 g/l at room temperature, especially amino acid salts of strontium or dicarboxylic acid salts of strontium. Examples of novel water-soluble  
10 strontium salts are e.g. strontium aspartate and strontium alpha-ketoglutarate.

The present invention also relates to an improved method for preparing the strontium salt of glutamic acid.

**15 Background of the Invention**

- Osteoporosis is the most common form of metabolic bone disease in humans. It is a condition, which affects a very large number of people all over the world, and as the number of elderly people is set to rise dramatically in the coming decades in most countries, the prevalence and impact of osteoporosis will also increase. The disease is  
20 characterized pathologically by an absolute decrease in the amount of bone mass and the structural quality of bone, and clinically by increased susceptibility to fractures. In fact, osteoporosis is the most significant underlying cause of skeletal fractures in late middle aged and elderly women.

- 25 In general, there are two types of osteoporosis: primary and secondary. Secondary osteoporosis is the result of an identifiable disease process or agent. However, approximately 90% of all osteoporosis cases are idiopathic primary osteoporosis. Such primary osteoporosis includes postmenopausal osteoporosis, age-associated osteoporosis (affecting a majority of individuals over the age of 70 to 80), and idiopathic  
30 osteoporosis affecting middle-aged and younger men and women.

- The mechanism of bone loss in osteoporosis is believed to involve an imbalance in the process of bone remodeling. Bone remodeling occurs throughout life, renewing the skeleton and maintaining the strength of bone. This remodeling is mediated by specialized  
35 cells of the bone tissue, called "osteoclasts" and "osteoblasts". Osteoclasts (bone dissolving or resorbing cells) are responsible for the resorption of a portion of bone within the bone matrix, during the resorption process. After resorption, the osteoclasts are

followed by the appearance of osteoblasts (bone forming cells), which then refill the resorbed portion with new bone.

- The formation of the two cell types as well as their activity in bone is usually tightly coupled and well regulated in order to maintain the skeletal balance and structural integrity of the bones. However, in people with osteoporosis an imbalance in this remodeling process develops, resulting in loss of bone at a rate faster than the accretion of bone.
- 10 The single most important risk factor for osteoporosis is oestrogen deficiency occurring naturally at the menopause. The decline in endogenous oestrogen production leads to an elevated metabolic activity in the bone tissue where the increase in osteoclast mediated bone resorption surpasses the more modest increase in bone formation resulting in a net loss of bone. The actual number of people affected will grow at a rate greater than simple population growth rates, because the aging of the population is disproportionately increasing the older segment of the population, while the age for the onset of menopause has remained constant. In the last decades there has also been a substantial advance in the ability to predict and monitor osteoporosis, as methods for measurement of bone mineral density (BMD) has improved and new specific biochemical markers of bone resorption and formation has been developed and made available for routine clinical use. New pharmaceutical agents for treatment and/or prevention of osteoporosis have also been developed. The majority of these treatments are either based on substituting the lost endogenous estrogen either in the form of hormone replacement therapy (HRT) or selective estrogen receptor modulators (SERM), or they belong to the class of compounds called bisphosphonates. SERM's and especially HRT is associated with significant side effects, such as increased risk of cancer and cardiovascular disease, whereas bisphosphonates in addition to a potent antiresorptive effect also decreases bone formation to a similar extent, implying that they lose their therapeutic effect after few years of treatment. Thus, there is a need for agents, which are effective in the treatment and/or prophylaxis of osteoporosis.

#### **Description of the invention**

- Previous studies have shown that various strontium compounds modulate bone loss in osteoporosis when present at levels higher than those required for normal cell physiology.
- 35 The effect is believed to be due to a stimulatory effect of strontium on pre-osteoblastic cell differentiation and migration, and a direct or matrix-mediated inhibition of osteoclast activity by strontium (Reginster, JY, *Curr pharm Des* 2002:8 (21):1907-16). In other words,

strontium both works as an anti-resorptive and an anabolic agent. Various salts of strontium are known from the prior art, such as, e.g., strontium ranelate (distrontium salt of 2-[N,N-di(carboxymethyl)amino]-3-cyano-4-carboxymethylthiophene-5-carboxylic acid) described in EP-B 0 415 850. The ranelate part of the strontium compound, derived from  
5 ranelic acid, is unlikely to have any therapeutic effect towards cartilage or bone conditions per se. Other known strontium salts are e.g., strontium tartrate, strontium phosphate, strontium carbonate, strontium nitrate, strontium sulfate and strontium chloride.

The naturally occurring salts of strontium, such as the carbonate and sulphate salts, have  
10 very low water solubility (0.15 g/l or below at room temperature). In contrast, the other strontium salts, such as strontium chloride, strontium hydroxide, strontium nitrate, strontium oxide and strontium acetate have very high solubilities in the range from 225 – 800 g/l in water. In this respect the strontium salts are very similar to the corresponding magnesium and calcium salts.

15 Organic strontium salts have been described, but literature reports of this type of compounds are limited to rather few substance. Again in these cases the physiochemical properties have been reported to be very similar to the corresponding magnesium, calcium and barium salts. Carboxylic acids can form stable crystalline salts with divalent  
20 earth metals such as strontium, and especially di-carboxylic acids are interesting, as they can have a partial chelating effect. Such complexation may be important in biological systems, where the alkaline earth metals, especially calcium and magnesium, plays important physiological roles (see the following sections). Hence the divalent metal ions may exist in a complex form in the aqueous environment in biological systems, rather than  
25 in a free and un-bound ionic form. Complex formation constants with the alkaline earth metals in aqueous solution are higher for amino acids than for hydroxy-carboxylic acids and the related non-carboxylic acids, which suggest that the amino group may play a role in the complex formation. Generally the differences in association constants for the various ligands becomes smaller as the radius of the metal increases, and thus stability of  
30 strontium complexes with di-carboxylic acid is lower than the stability of the comparable complexes with calcium and magnesium.

For a pharmaceutical application of the strontium salts this is very important as it means that strontium salts of dicarboxylic amino acids may be particularly useful. We have found  
35 that such salts, such as strontium glutamate and strontium aspartate is more soluble than other dicarboxylic strontium salts of similar molecular size. In pure aqueous solutions of such salts strontium exists in partly complexed form. However, when administered to an

animal such as a mammal, i.e. a rat, dog, monkey or human, ionic strontium as well as strontium complexed to the carboxylic acid anion will be taken up from the intestinal lumen by both passive and active transport mechanisms. In this case strontium will be displaced from the complexes by available calcium and magnesium which forms much more stable  
5 complexes with the ionized amino acids. It appears that with the heavy group II metals, such as strontium, the amino group in both aspartate and glutamate is much less significant for metal complexation, probably due to the unfavourable chelation of large metals in five- or six-membered rings. Accordingly, dianionic amino-acid salts of strontium, such as strontium aspartate and strontium glutamate may be especially suited for  
10 prophylactic and/or therapeutic interventions in bone disease as the amino-acids may act to preferentially bind/complex with available free calcium, thus promoting both the intestinal uptake of the calcium ion, and physiological action of the ion, in particular its role in regulation of bone turnover.

15 However, the present invention is not limited to the above-mentioned specific examples of suitable salts, but merely to the general applicability of water-soluble salt of strontium. As appears from the above, the known strontium salt that are water-soluble have a water-solubility of at least about 225-800 g/l and the other known strontium salts have solubilities that are very low (below 0.1g/l at room temperature). The exemplified amino acids salts of  
20 strontium that are exemplified herein and that have suitable *in vivo* properties have a water solubility of 1 g/l or more and not more than about 100 g/l at room temperature. Accordingly, the invention relates to strontium salts that have a water-solubility from about 1 g/l to about 100 g/l at room temperature.

25 As it appears from the above, the present invention relates to novel strontium salts and pharmaceutical compositions containing them for use in the treatment and/or prophylaxis of cartilage and/or bone conditions and for methods of treating such conditions. One of the strontium salts has been described before, namely the strontium glutamate. However, the present inventors have found an improved method for the preparation of this salt and the  
30 method is also an object of the invention. Furthermore, the invention relates to the therapeutic, prophylactic and/or diagnostic use of the strontium salt having a water-solubility in a range of from about 1 g/l to about 100 g/l.

For the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions  
35 resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of

malignancy, periodontal disease, hyperparathyroidism, periarthritic erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the present inventors have found that the use of a strontium salt has prophylactic and/or therapeutic value in that one or more of the following beneficial effects can be obtained:

- i) an improved bioavailability of strontium,
- ii) an improved absorption of strontium,
- iii) a reduction of side effects,
- iv) a flexible dose adjustment of strontium in order to tailor prevention and/or treatment of a specific disease stage,
- v) a possible reduction in daily dosage
- vi) a possible reduction of the number of different pharmaceutical compositions that a patient must use to achieve a therapeutic effect.

Suitable strontium salts for use according to the invention or for use in admixture with a strontium salt according to the invention are found in the following list. However, only those salts that have a water-solubility of at least about 1 g/l and at the most about 100 g/l are object of the present invention. Such strontium salts are e.g. the amino acid salts strontium glutamate and strontium aspartate; strontium malonate; strontium pyruvate, strontium alpha-ketoglutarate, strontium maleate and strontium succinate.

The inorganic acid for making strontium salts may be selected from the group consisting of boric acid, bromous acid, chloric acid, diphosphoric acid, disulfuric acid, dithionic acid, dithionous acid, fulminic acid, hydrazoic acid, hydrobromic acid, hydrofluoric acid, hydroiodic acid, hydrogen sulfide, hypophosphoric acid, hypophosphorous acid, iodic acid, iodous acid, metaboric acid, metaphosphoric acid, metaphosphorous acid, metasillicic acid, nitrous acid, orthophosphoric acid, orthophosphorous acid, orthosillicic acid,

phosphoric acid, phosphinic acid, phosphonic acid, pyrophosphorous acid, selenic acid, sulfonic acid, thiocyanic acid and thiosulfuric acid.

- The organic acid may be selected from the group consisting of  $C_2H_5COOH$ ,  $C_3H_7COOH$ ,  
5  $C_4H_9COOH$ ,  $(COOH)_2$ ,  $CH_2(COOH)_2$ ,  $C_2H_4(COOH)_2$ ,  $C_3H_6(COOH)_2$ ,  $C_4H_8(COOH)_2$ ,  
 $C_5H_{10}(COOH)_2$ , fumaric acid, maleic acid, malonic acid, lactic acid, citric acid, tartaric acid,  
oxalic acid, ascorbic acid, benzoic acid, salicylic acid, pyruvic acid, L- and D-aspartic acid,  
phthalic acid, carbonic acid, formic acid, methanesulfonic acid, ethanesulfonic acid,  
camphoric acid, gluconic acid, L- and D-glutamic acid, trifluoroacetic acid, ranellic acid,  
10 2,3,5,6-tetrabromobenzoic acid, 2,3,5,6-tetrachlorobenzoic acid, 2,3,6-tribromobenzoic  
acid, 2,3,6-trichlorobenzoic acid, 2,4-dichlorobenzoic acid, 2,4-dihydroxybenzoic acid, 2,6-  
dinitrobenzoic acid, 3,4-dimethoxybenzoic acid, abietic acid, acetoacetic acid,  
acetonedicarboxylic acid, aconitic acid, acrylic acid, adipic acid, alpha-ketoglutaric acid,  
anthranilic acid, benzilic acid, arachidic acid, azelaic acid, behenic acid, benzenesulfonic  
15 acid, beta-hydroxybutyric acid, brassidic acid, capric acid, chloroacrylic acid, cinnamic  
acid, citraconic acid, crotonic acid, cyclopentane-1,2-dicarboxylic acid,  
cyclopentanecarboxylic acid, cystathionine, decanoic acid, erucic acid,  
ethylenediaminetetraacetic acid, fulvic acid, fumaric acid, gallic acid, glutaconic acid,  
glutaric acid, gulonic acid, heptanoic acid, hexanoic acid, humic acid, hydroxystearic acid,  
20 isophthalic acid, itaconic acid, lanthionine, lauric acid (dodecanoic acid), levulinic acid,  
linoleic acid (cis,cis-9,12-octadecadienoic acid), malic acid, m-chlorobenzoic acid, melissic  
acid, mesaconic acid, methacrylic acid, monochloroacetic acid, myristic acid,  
(tetradecanoic acid), nonanoic acid, norvaline, octanoic acid, oleic acid (cis-9-  
octadecenoic acid), ornithine, oxaloacetic acid, palmitic acid (hexadecanoic acid), p-  
25 aminobenzoic acid, p-chlorobenzoic acid, petroselinic acid, phenylacetic acid, p-  
hydroxybenzoic acid, pimelic acid, propiolic acid, propionic acid, p-tert-butylbenzoic acid,  
p-toluenesulfonic acid, pyruvic acid, sarcosine, sebacic acid, serine, sorbic acid, stearic  
acid (octadecanoic acid), suberic acid, succinic acid, terephthalic acid, tetrollic acid,  
threonine, thyronine, tricarballic acid, trichloroacetic acid, trimellitic acid, trimesic acid,  
30 tyrosine, ulmic acid and cyclohexanecarboxylic acid.

All acids, which FDA has regarded as safe for use in compositions for oral intake, may be used in the present invention. Examples of suitable acids are mentioned in the following table 1:

In one embodiment of the invention, the acid may be a non-chelator of strontium. In yet a further embodiment, the acid may be a monoprotic or a diprotic acid.

- 5 The strontium salt for use according to the invention is water soluble, having a water solubility of at least 1 g/l, such as, e.g., at least 5 g/l, at least 10 g/l, at least 20 g/l, at least 30 g/l, at least 40 g/l, at least 50 g/l, at least 60 g/l, at least 70 g/l, at least 80 g/l, at least 90 g/l or about 100 g/l measured at room temperature, i.e a temperature of 20-25°C.
- 10 Specific examples of strontium salts for use according to the invention are strontium malonate, strontium succinate, strontium fumarate, strontium ascorbate, strontium aspartate in either L and/or D-form, strontium glutamate in either L- and/or D-form, strontium pyruvate, strontium tartrate, strontium glutarate, strontium maleate, strontium methanesulfonate, strontium benzenesulfonate and mixtures thereof.
- 15 Strontium L-glutamate (hexahydrate) has previously been prepared by reacting strontium hydroxide with L-glutamic acid under reflux for 3 hours with a subsequent cooling and slow crystallization over a period of 2 weeks. The crystals were subjected to X-ray crystallography in order to elucidate the crystal structure (please see: H. Schmidbaur, I. Bach, L. Wilkinson & G. Müller (1989), Chem Ber. 122; 1433-1438). The investigations were related to a crystalline form of the strontium salts with the properties described in figures 1 and 2 and tables 2 and 3.

Table 3: Fractional atomic coordinates and equivalent isotropic thermal parameters for strontium L-glutamate hexahydrate as described by Schmidbaur et al 1989.  $U_{eq} = (U_1 \cdot U_2 \cdot U_3)$ , where  $U_1$ ,  $U_2$  and  $U_3$  are the intrinsic values of the  $U_{ij}$  matrix. For atom nomenclature please refer to figure 1.

15

As apparent from the data disclosed in figures 1 and 2 and table 2 and 3, the strontium glutamate salt in hexahydrate form described by Schmidbaur et al is an orthorhombic crystal form belonging to space group  $P2_12_12_1$ . The cell size is defined by the following dimensions (given in Å): a 3.355, b 8.772, c 20.283, with a unit cell volume of 1308.6 Å<sup>3</sup>.

- 5 The solubility of the isolated strontium glutamate (hexahydrate) with the properties as described (Schmidbaur, I Bach, L Wilkinson & G Müller (1989), Chem Ber. 122; 1433-1438) was reported as 0.023 g/l at 20°C.

- 10 Strontium L-aspartate has also previously been prepared by reacting L-aspartic acid with strontium hydroxide. The reaction was performed over 3 hours under reflux, and the resulting reaction mixture was allowed to cool over three days to initiate crystal formation. The resulting strontium L-aspartate crystals were subjected to X-ray crystallography in order to elucidate the crystal structure (please see: H. Schmidbaur, P. Mikulcik & G. Müller (1990), Chem Ber. 123; 1599-1602). The investigations revealed that the isolates
- 15 strontium L-aspartate salt was formed in the trihydrate form with the properties described in figure 3 and tables 4 and 5.

Table 4: Fractional atomic coordinates and equivalent isotropic thermal parameters for strontium glutamate hexahydrate as described by Schmidbaur et al 1990.  $U_{eq} = (U_1 \cdot U_2 \cdot U_3)$ , where  $U_1$ ,  $U_2$  and  $U_3$  are the intrinsic values of the  $U_{ij}$  matrix. For atom nomenclature please refer to figure 3.

As apparent from the data disclosed in figures 3 and table 3 and 4, the strontium glutamate salt in hexahydrate form described by Schmidbaur et al is an orthorhombic crystal form belonging to space group  $P2_12_12_1$ . The cell size is defined by the following dimensions (given in Å): a 7.304, b 9.914, c 11.837, with a unit cell volume of 857.1 Å<sup>3</sup>. The solubility of the isolated strontium aspartate trihydrate salt was not reported (H. Schmidbaur, P. Mikulcick & G. Müller (1990), Chem Ber. 123; 1599-1602).

Other examples of relevant acids for making strontium salts for use in a pharmaceutical composition may be found in WO 00/01692, which is hereby incorporated by reference.

#### *Synthesis of strontium salts*

Organic strontium salts of carboxylic acid anions can be synthesized by a number of different pathways. A conventional method for preparation of such organic strontium salts is to utilise the reaction between and organic acid and strontium hydroxide in an aqueous solution. This neutralisation reaction of, e.g. fumaric acid and strontium hydroxide salt follows the following scheme:

30

The suspension of dissolved strontium fumarate can then be induced to precipitate by sublimation of water and subsequent up-concentration of the salt. Crystals will slowly form and precipitate from the solution.

- 5 An alternative approach is to utilise the sodium or potassium salt of the appropriate carboxylic acid anion and strontium chloride. As all organic strontium salts will be less soluble than the highly soluble chloride salt, the organic strontium salt will precipitate under these conditions leaving NaCl and excess  $\text{SrCl}_2$  in the solution. The equation below exemplifies this reaction scheme using as an example the reaction between  $\text{SrCl}_2$  and
- 10 sodium-fumarate.

- The present inventors have found that different strontium salts requires different synthesis pathways, and for some strontium salts we have identified optimized synthesis and
- 15 manufacturing procedures. Of particular relevance for the present invention, it has been found that synthesis of strontium salts of the di-carboxylic aminoacids aspartate and glutamate (in either D- or L- form) is very difficult when following these conventional reaction pathways, and generally results in low yields and purity of the obtained crystalline salt. In order to facilitate large-scale manufacture of pure strontium salts of dicarboxylic
- 20 amino acids to carry out the pharmaceutical use according to the present invention, the present inventors have studied various synthesis pathways of these particular strontium salts. Thus, it has surprisingly been found that synthesis of well defined and pure strontium glutamate in hexahydrate form is most convenient carried out with the free acid form of glutamate and strontium hydroxide and requires elevated temperatures, such as
- 25 temperatures above  $80^{\circ}\text{C}$ , or more preferred  $100^{\circ}\text{C}$  or even  $120^{\circ}\text{C}$  or most preferred more than  $130^{\circ}\text{C}$  (see examples 4 - 7). Furthermore, we have found that addition of small volumes of alcohol can accelerate the crystal-formation of dissolved aqueous organic strontium salts. In the present invention new crystalline forms of strontium salts of dicarboxylic acids are disclosed. In particular we have found that synthesis of strontium L-
- 30 glutamate from L-glutamic acid and  $\text{SrCl}_2$  results in a new hexahydrate crystalline form distinct from the previously described strontium L-glutamate hexahydrate as described in figure 1 and 2 and tables 2 and 3.

- Examples of these synthesis procedures for organic strontium salts of relevance for the
- 35 treatment and/or prophylaxis of bone disease are provided in the examples herein.

In one aspect of the invention a method for the preparation of strontium salts including strontium glutamate is provided.

The invention further relates to the strontium salts for use in medicine. As mentioned  
5 above strontium (and sometimes its counter ion such as, e.g. alpha-ketoglutarate or an amino acid) is believed to have an effect on cartilage and/or bone conditions and/or other conditions, thus the salt may be used for the preparation of a pharmaceutical composition for the treatment and/or prophylaxis of a cartilage and/or a bone condition including the ones mentioned above. The salt may also be used for the preparation of a pharmaceutical  
10 composition for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain. The pharmaceutical composition may further comprise one or more physiologically acceptable excipients.

For the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions  
15 resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, the possibility of administering various amounts of strontium and, if relevant alpha-ketoglutarate or an amino acid like e.g. glutamic acid and/or aspartic acid, respectively, may be desired. The amount of strontium (and, if relevant e.g. alpha-ketoglutarate or an amino acid) in a pharmaceutical composition according to the invention may be adjusted  
20 by adding an additional amount of strontium in the form of a strontium-containing compound (and/or, if relevant, an additional amount of alpha-ketoglutarate or an amino acid) to the composition. The strontium-containing compounds may be selected from the salts mentioned above.

25 In certain cases it may be beneficial to further add one or more active substances to a pharmaceutical composition according to the invention. The one or more active substances may have a therapeutic and/or prophylactic effect on a cartilage and/or a bone disease and/or other conditions such as those mentioned above. The term "active substance having a therapeutic and/or prophylactic effect on diseases and conditions  
30 affecting metabolism and structural integrity of cartilage and/or bone" includes active substances that can attain a particular medical result, such as, e.g., reduce the incidence of bone fracture, increase bone density and/or improve healing of bone or decrease or halt the degradation of articular cartilage or promote formation of new cartilage or prevent or decrease progression of radiological evident joint damage. Examples of such  
35 substances are bone anti-resorptive and/or anabolic agents. However, one or more active substances having other effects than those mentioned above may also be included in a pharmaceutical composition of the invention. Such active substances could be e.g.

disease-modifying anti-rheumatic drugs, or other anti-rheumatic drugs.

Specific examples of active substances, which may be used in a pharmaceutical composition according to invention are calcium-alpha-ketoglutarate, calcium and/or salts thereof, vitamin D such as, e.g., vitamin D3 and/or functional equivalents of vitamin D3, glucagon-like peptide-2, glucagon-like peptide-2 releasing compositions, bisphosphonates including ibandronate, zoledronate, alendronate, risedronate, ethidronate, clodronate, tiludronate and pamidronate; selective estrogen receptor modulators (SERMs) including raloxifene, arzoxifene, droloxifene, tamoxifen, 4-hydroxy-tamoxifen, 4'-iodotamoxifen, toremifene, (deaminohydroxy)-toremifene, chlomiphene, levormeloxifene, ormeloxifene, chroman derivatives, coumarin derivatives, idoxifene, nafoxidine, TAT-59, LY-353381, CP-336156, MDL-103323, EM-800, ICI-182, ICI 183,780, ICI 164,384, ICI 183,780, ICI 164,384, diethylstilbestrol, genistein, nafoxidine, nitromifene citrate, moxesterol, diphenol hydrochrysene, erythro-MEA, allenolic acid, equilin-3-sulphate, cyclophenyl, chlorotrianisene, ethamoxytriphetol, lasofoxifene, bazedoxifene, genistein, tibolone, ospemifene, tesmilofene, droloxifene, panomifene, zindoxifene, meprofoxifene and faslodex; calcitonin, parathyroid hormone, parathyroid hormone related peptide, glucosamine sulphate, glutamic acid and/or salts thereof, aspartic acid and/or salts thereof, proline, glutamine and hydroxyproline.

20

As mentioned above, the compounds and compositions of the present invention may be used for the treatment and prophylaxis of various conditions. Thus, the present invention relates to a method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as the ones mentioned above, for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof a therapeutic and/or prophylactic effective amount of a strontium salt having a water-solubility in the range claimed herein.

30

The subject may be a mammal, such as, e.g. a human or a domestic animal, such as, e.g., a cat, a dog, a horse, a cow or a sheep.

The invention also relates to a method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as the ones mentioned above, for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight

gain, the method comprising administering to a subject in need thereof an amount of the strontium salt according to the invention.

The daily dose of strontium may be at least about 0.01 g, such as, e.g., at least about  
5 0.025 g, at least about 0.050 g, at least about 0.075 g, at least about 0.1 g, at least about 0.2 g, at least about 0.3 g, at least about 0.4 g or at least about 0.5 g or from about 0.01 g to about 2 g such as, e.g., from about 0.1 g to about 2 g, from about 0.3 g to about 2 g or from about 0.3 g to about 1 g.

10 The invention also relates to a method wherein the strontium salt is administered in the form of a pharmaceutical composition as described above.

The invention further relates to a method wherein the administration may take place one or more times daily, such as from 1 to 5 times daily.

15

The invention also relates to a method wherein the administration may take place one or more times weekly, such as from 1 to 3 times weekly.

As described above, one or more active substances may be added to a pharmaceutical  
20 composition according to the invention, or administered as part of the same treatment as the administration of strontium salt. One example of such an active substance is Vitamin D. Vitamin D plays a major role in calcium absorption, since activated vitamin D<sub>3</sub> (1,25-dihydroxycholecalciferol) and to a smaller extent other active forms of vitamin D, acts to increase the calcium absorption from the small intestine. Vitamin D<sub>3</sub> acts to increase the  
25 entry of calcium through the plasma membrane into the enterocytes, and is capable of reducing the excretion of calcium to urine by increasing the reabsorption of calcium in kidneys. It is likely that vitamin D has the same effect on strontium absorption as it has on calcium absorption.

30 Vitamin D is activated in e.g. the liver and kidneys. High levels of calcium are having a reducing effect on activation of vitamin D, and high levels of strontium will probably have the same effect as calcium on the activation of vitamin D.

Thus, the administration of an amount of vitamin D together with a strontium-containing  
35 compound according to the invention will most likely have a beneficial effect on the uptake of strontium.

Accordingly, the invention relates to a method according to the invention further comprising administering a daily dose of vitamin D.

In a specific embodiment, vitamin D may be vitamin D<sub>3</sub>, and the daily dose of vitamin D<sub>3</sub> may be at least about 1  $\mu$ g, such as, e.g. at least about 1.25  $\mu$ g at least about 1.50  $\mu$ g, at least about 2  $\mu$ g, at least about 3  $\mu$ g, at least about 4  $\mu$ g, at least about 5  $\mu$ g, at least about 10  $\mu$ g, at least about 15  $\mu$ g, at least about 20  $\mu$ g, at least about 25  $\mu$ g, at least about 30  $\mu$ g, at least about 40  $\mu$ g or at least about 50  $\mu$ g or from about 1  $\mu$ g to about 50  $\mu$ g such as, e.g., from about 1.50  $\mu$ g to about 40  $\mu$ g, from about 2  $\mu$ g to about 30  $\mu$ g, from about 3  $\mu$ g to about 30  $\mu$ g, from about 4  $\mu$ g to about 30  $\mu$ g, from about 5  $\mu$ g to about 30  $\mu$ g, from about 10  $\mu$ g to about 30  $\mu$ g, from about 10  $\mu$ g to about 20  $\mu$ g or from about 15  $\mu$ g to about 25  $\mu$ g.

More specifically, the daily dose of vitamin D<sub>3</sub> may be from about 5  $\mu$ g to about 30  $\mu$ g, such as, e.g., from about 10  $\mu$ g to about 20  $\mu$ g.

In a further method according to the invention, the strontium component may be administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, the alpha-ketoglutarate component may be administered in a dose corresponding to a daily dose of from about 2 g to about 7 g and vitamin D<sub>3</sub> may be administered in a dose corresponding to a daily dose of from about 10  $\mu$ g to about 20  $\mu$ g.

Another active form of vitamin D to be used in a method according to the invention is vitamin D<sub>2</sub>. The daily dose of vitamin D<sub>2</sub> may be at least 1  $\mu$ g, such as, e.g. at least about 1.50  $\mu$ g, at least about 2  $\mu$ g, at least about 3  $\mu$ g, at least about 4  $\mu$ g, at least about 5  $\mu$ g, at least about 10  $\mu$ g, at least about 15  $\mu$ g, at least about 20  $\mu$ g, at least about 25  $\mu$ g, at least about 30  $\mu$ g, at least about 40  $\mu$ g, at least about 50  $\mu$ g, at least about 60  $\mu$ g, at least about 70  $\mu$ g, at least about 80  $\mu$ g, at least about 90  $\mu$ g, at least about 100  $\mu$ g, at least about 110  $\mu$ g, at least about 120  $\mu$ g or at least about 125  $\mu$ g or from about 1  $\mu$ g to about 125  $\mu$ g such as, e.g., from about 1.50 to about 120  $\mu$ g, from about 2  $\mu$ g to about 110  $\mu$ g, from about 3  $\mu$ g to about 100  $\mu$ g, from about 4  $\mu$ g to about 90  $\mu$ g, from about 5  $\mu$ g to about 80  $\mu$ g, from about 5  $\mu$ g to about 125  $\mu$ g, from about 10  $\mu$ g to about 70  $\mu$ g, from about 10  $\mu$ g to about 60  $\mu$ g, from about 10  $\mu$ g to about 50  $\mu$ g, from about 10  $\mu$ g to about 40  $\mu$ g, from about 10  $\mu$ g to about 30  $\mu$ g, from about 10  $\mu$ g to about 20  $\mu$ g, or from about 15  $\mu$ g to about 25  $\mu$ g.

More specifically, the daily dose of vitamin D<sub>2</sub> is from about 5  $\mu$ g to about 125  $\mu$ g, such as,

e.g., from about 10  $\mu$ g to about 20  $\mu$ g.

- Other functional equivalents of vitamin D<sub>3</sub> and D<sub>2</sub>, such as alphacalcidol, calcitriol or dihydrotachysterol, may also be administered according to the invention. Alpha-calcidol, 1 $\alpha$ -hydroxy-cholecalciferol, may be administered in amounts of 0.2-3  $\mu$ g/day, preferably 0.25-2  $\mu$ g/day. Calcitriol, 1,25-dihydroxy-cholecalciferol, may be administered in amounts of 0.1-10  $\mu$ g/day, preferably 0.125-2  $\mu$ g/day and dihydrotachysterol, a vitamin D<sub>2</sub> analogue, may be administered in amounts of 0.1-3 mg/day, preferably 0.2-0.6 mg/day.
- 10 In yet a further method, the administration of the strontium component, the alpha-ketoglutarate or amino acid component, if relevant, and vitamin D takes place simultaneously.

- In another method, the administration of the strontium component, the alpha-ketoglutarate or amino acid component, if relevant, and/or vitamin D take place sequentially.
- 15

- Calcium is another example of an active substance that may be administered as part of the same treatment as the administration of strontium salt. Calcium is the most abundant mineral in the body, and a major constituent of bone and teeth as calcium phosphate and calcium carbonate. Calcium is also essential in intra- and extracellular fluid exchange, blood clotting, and in maintaining a regular heartbeat. It is also important in the initiation of neuromuscular as well as metabolic functions. Most of the calcium in the body is stored in the bones.
- 20

- 25 Thus, calcium is an important participant in many processes in the body, and administration of calcium may have a therapeutic and/or prophylactic effect on many of the diseases and conditions mentioned above.

- Accordingly, the present invention relates to a method as described above further comprising administering a daily dose of calcium.
- 30

- In a specific method according to the invention the daily dose of calcium is from about 0.5 g to about 2 g such as, e.g., 0.5 g to about 1.5 g, from 0.5 g to 1 g and from about 1 g to about 1.5 g.
- 35

In yet another method according to the invention, the strontium component is administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, the

alpha-ketoglutarate or amino acid component is administered in a dose corresponding to a daily dose of from about 2 g to about 7 g and the dose of calcium corresponds to a daily dose of from about 0.5 g to about 1 g.

- 5 The administration of the strontium salt, the alpha-ketoglutarate or amino acid component, if relevant, and calcium may take place simultaneously, either in a single administration form or in separate administration forms for simultaneous administration as described above.
- 10 Alternatively, the strontium salt, the alpha-ketoglutarate or amino acid component, if relevant, and calcium may be administered sequentially.

Studies have shown that strontium is a full agonist of the calcium-sensing receptor (CaR). Even though the role of the CaR in regulating bone cells is not fully investigated, it  
15 appears that strontium and calcium may exert their effect on bone metabolism via the same receptor.

Accordingly, it may be beneficial not to administer the strontium-containing component and calcium at the same time.

20

In one aspect of the present invention, calcium may be administered after the administration of strontium, i.e. the invention relates to a method, wherein calcium is administered at least 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h  
25 or at least 12 h after the administration of the strontium component.

In another aspect calcium may be administered before the administration of strontium, i.e. the invention relates to a method, wherein calcium is administered at least 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7  
30 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of the strontium component.

In yet another aspect, the strontium salt and the alpha-ketoglutarate or amino acid component, if relevant, may be administered simultaneously and calcium may be  
35 administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of the strontium salt.

In a further aspect, the strontium salt and the alpha-ketoglutarate or amino acid component, if relevant, may be administered simultaneously and calcium may be administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h,  
5 at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of the strontium salt.

In yet a further aspect, calcium and vitamin D may be administered simultaneously at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at  
10 least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the simultaneously administration of a strontium salt and vitamin D.

In another aspect calcium and vitamin D may be administered simultaneously in the morning, and a strontium salt and vitamin D may be administered simultaneously in the  
15 evening.

A further example of an active substance that may be administered as part of the same treatment as the administration of strontium is parathyroid hormone. Parathyroid hormone is composed of 84 amino acid residues and is released in vivo in response to a decrease  
20 in the level of extra cellular calcium. Administration of PTH or fragments thereof in a pharmaceutically relevant dose is known to stimulate bone formation, produce a robust increase in bone mineral density and substantially reduce the occurrence of vertebral and non-vertebral fractures. Parathyroid hormone acts directly on the kidney to diminish urinary calcium, and increases bone resorption via an indirect mechanism involving  
25 osteoblasts. Parathyroid hormone also increases the activation of vitamin D by stimulating the activity of 1 $\alpha$ -hydroxylase enzyme in the kidney, subsequently leading to a better absorption of calcium and, possibly, strontium.

A commercially available parathyroid hormone containing drug comprises the 34 N-terminal amino acids region of human parathyroid hormone, which is believed to be the  
30 biologically active region.

Accordingly, in a further method according to the invention an amount of parathyroid hormone, or a fragment or analogue thereof, or a parathyroid hormone related peptide, or  
35 a fragment or analogue thereof, is administered as part of the same treatment as the administration of strontium salt. In the following the term "PTH" covers parathyroid hormone, fragments, analogues and functional analogues thereof together with

parathyroid related hormone and fragments, analogues and functional analogues thereof. PTH may be used as a combined or sequential administration with strontium and, if relevant, alpha-ketoglutarate.

- 5 The daily dose of PTH, when calculated as recombinant human parathyroid hormone (1-34), may be at least 1  $\mu$ g, such as, e.g. at least about 2  $\mu$ g, at least about 3  $\mu$ g, at least about 4  $\mu$ g, at least about 5  $\mu$ g, at least about 10  $\mu$ g, at least about 15  $\mu$ g, at least about 20  $\mu$ g, at least about 25  $\mu$ g, at least about 30  $\mu$ g, at least about 35  $\mu$ g, at least about 40  $\mu$ g, at least about 50  $\mu$ g, or at least about 60  $\mu$ g, or from about 1  $\mu$ g to about 60  $\mu$ g such
- 10 as, e.g., from about 2 to about 50  $\mu$ g, from about 3  $\mu$ g to about 40  $\mu$ g, from about 4  $\mu$ g to about 40  $\mu$ g, from about 5  $\mu$ g to about 40  $\mu$ g, from about 10  $\mu$ g to about 40  $\mu$ g, from about 10  $\mu$ g to about 35  $\mu$ g, from about 10  $\mu$ g to about 30  $\mu$ g, from about 10  $\mu$ g to about 25  $\mu$ g, from about 10  $\mu$ g to about 20  $\mu$ g, from about 15  $\mu$ g to about 40  $\mu$ g, from about 20  $\mu$ g to about 40  $\mu$ g or from about 20  $\mu$ g to about 30  $\mu$ g.

15

More specifically, the daily dose of PTH, when calculated as recombinant human parathyroid hormone (1-34), may be from about 10  $\mu$ g to about 40  $\mu$ g, such as, e.g., from about 10  $\mu$ g to about 30  $\mu$ g, from about 10  $\mu$ g to about 20  $\mu$ g, from about 20  $\mu$ g to about 40  $\mu$ g or from about 20  $\mu$ g to about 30  $\mu$ g.

20

The medical treatment according to the invention may comprise administration of a daily dose of bisphosphonate from about 0.1 mg to 60 mg, such as from about 0.2 mg to about 30 mg, from about 0.2 mg to about 20 mg or from about 0.2 mg to about 10 mg.

- 25 In a combination treatment according to the invention in which a strontium containing compound is given in combination with one or more SERM's, the SERM should be used in a dose as determined previously from clinical investigation of the given SERM.

- In the following is given a more detailed description of individual salts according to the invention. Especially, with respect to strontium alpha-ketoglutarate and amino acid salts of strontium, these salts have two active principles, i.e. the strontium part and the alpha-ketoglutarate or amino acid part. Accordingly, these aspects of the invention include individual dose adjustment by addition e.g. of a separate dose of one of the individual components. However, all details with respect to strontium apply also for all the other
- 30 strontium salts according to the invention.
- 35

Furthermore, the details and particulars described above for strontium salts apply *mutatis mutandis* to the individual strontium salts, whenever relevant, as well as details and particular described below for the individual strontium salts apply *mutatis mutandis* to the strontium salts in general, whenever relevant.

5

***Strontium/alpha-ketoglutarate salts and compositions***

Bone consists of an organic matrix comprising predominantly collagen type I, and an inorganic phase comprising calcium phosphate and calcium carbonate. The amino acid sequence of collagen type I is remarkably regular with nearly every third residue being  
10 glycine. Proline is also present to a much greater extent in collagen than in most other proteins. Moreover, the sequence glycine – proline – 4-hydroxyproline recurs frequently. Alpha-ketoglutarate (AKG) is presumed to be a bone mineral density increasing and bone strength increasing agent for the treatment of osteoporosis and other bone conditions since alpha-ketoglutarate is a precursor of glutamate, which may be converted to proline,  
15 an important component of collagen. Alpha-ketoglutarate also participates in the conversion of proline to 4-hydroxyproline. The proline residues in collagen may be hydroxylated at C-4 by prolyl hydroxylase to form 4-hydroxyproline. For this process alpha-ketoglutarate, molecular oxygen and ascorbate are required.

20 Furthermore, alpha-ketoglutarate is a very important intermediate in the citric acid cycle. In the citric acid cycle acetyl CoA is completely oxidized to CO<sub>2</sub> via interconversions of various carboxylic acids, including AKG. This results in the reduction of NAD and FAD to NADH and FADH<sub>2</sub>, whose reducing power is then used indirectly in the synthesis of ATP.

25 For the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in  
30 rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-  
35 induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the

5 maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the present inventors have found that the use of a strontium containing compound together with an alpha-ketoglutarate-containing compound has prophylactic and/or therapeutic value in that one or more of the following beneficial effects can be obtained:

- 10           vii)    an improved bioavailability of strontium and/or alpha-ketoglutarate,
- viii)   an improved absorption of strontium and/or alpha-ketoglutarate,
- ix)    a reduction of side effects,
- x)     a flexible dose adjustment of strontium and alpha-ketoglutarate in order to tailor prevention and/or treatment of a specific disease stage,
- xi)    an additive and possible synergistic effect of strontium and alpha-ketoglutarate,
- xii)   a possible reduction in daily dosage
- 15          xiii)   a possible reduction of the number of different pharmaceutical compositions that a patient must use to achieve a therapeutic effect.

20 Thus, it is believed that strontium administered together with alpha-ketoglutarate gives a more efficient prevention and/or treatment than either strontium or alpha-ketoglutarate administered alone. This implies that smaller doses of strontium and alpha-ketoglutarate may be used when administered together, as compared to individual administration of the two compounds. The daily dose of alpha-ketoglutarate needed for the treatment and/or prophylaxis of some of the above-mentioned conditions may be rather large, i.e. the subject in the need of treatment will have to take large amounts of alpha-ketoglutarate at a

25 time, or the frequency of intake of the doses may be high, both being of great inconvenience for the subject. The possibility of using smaller doses of strontium and alpha-ketoglutarate would be much more convenient for the subject in the need of treatment.

30 Thus, the invention relates to a pharmaceutical composition comprising a therapeutic and/or prophylactic effective amount of one or more first components containing a strontium compound and one or more second components containing an alpha-ketoglutarate compound, together with one or more physiologically acceptable excipients.

35 The above-mentioned strontium salts of organic or inorganic acids and salts of alpha-ketoglutaric acid may be in a composition as described above. The salts may be in hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or

polymeric form. In one embodiment of the invention only non-radioactive isotopes of strontium are used.

Below follows examples of salts of alpha-ketoglutaric acid, which may be used to adjust the amount of alpha-ketoglutarate in a pharmaceutical composition comprising strontium alpha-ketoglutarate, or in a pharmaceutical composition comprising a strontium-containing compound and an alpha-ketoglutarate compound as described above. The salt may be a salt of an alkali metal, a mixed salt of alkali metals, an alkaline earth metal, or mixtures thereof.

10

Specific examples of salts for use according to the invention may be sodium alpha-ketoglutarate, potassium alpha-ketoglutarate, lithium alpha-ketoglutarate, magnesium alpha-ketoglutarate, calcium alpha-ketoglutarate and mixtures thereof.

15 The salt may also be a salt of an amine or an amino acid or an ammonium salt or mixtures thereof. The amine may be selected from methyl amine, ethyl amine, propyl amine, isopropyl amine and butyl amine, and the amino acid may be selected from arginine, ornithine, lysine and histidine.

20 As exemplified by the salts mentioned above, the counter ions in the strontium and alpha-ketoglutarate-containing compounds may be active substances having the same medical indications as strontium and alpha-ketoglutarate. Examples of such compounds are e.g., strontium glutamate and calcium alpha-ketoglutarate. A composition containing strontium and alpha-ketoglutarate could therefore contain strontium glutamate and calcium alpha-

25 ketoglutarate. However, treatment of some conditions will require relatively large doses of strontium and alpha-ketoglutarate to be administered. This makes the total amount of such a pharmaceutical composition that has to be administered to the subject in the need of treatment relatively large, which may be of great inconvenience to the subject.

30 The present inventors have found a novel strontium salt of alpha-ketoglutaric acid with the following formula I:

35 which may be in a hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or polymeric form.

The novel salt of the above-mentioned formula is composed of two active substances, i.e. a bone anti-resorptive and bone anabolic agent in the form of strontium, and then a further amount of a bone mineral density increasing, bone strength and bone quality increasing agent in the form of alpha-ketoglutarate. As compared to previous known strontium salts, such as, e.g., strontium ranelate or strontium chloride, wherein only the strontium ion has a therapeutic and/or prophylactic effect on bone and/or cartilage diseases, both components in the novel salt are active components having a therapeutic and/or prophylactic effect.

10 By using the novel salt in pharmaceutical formulations, it may be possible to reduce the size of the formulations, even though the same dose of strontium and alpha-ketoglutarate is administered as in formulations comprising strontium and alpha-ketoglutarate as separate salts, together with their respective counter ions.

15 Furthermore, as described above the combination of strontium and alpha-ketoglutarate in the novel salt may have additive or synergistic beneficial effects on bone and/or cartilage tissue. Furthermore, the novel salt has suitable properties with respect to physio-chemical properties such as, e.g., water solubility; and it has technical properties suitable for processing the novel salt into pharmaceutical compositions.

20 The invention also relates to a process for preparing the novel strontium alpha-ketoglutarate substance according to the invention. The salt may be prepared by any method known to a person skilled in the art for preparing such salt. One example of such a process comprises reacting a salt of strontium with alpha-ketoglutaric acid or a salt thereof, wherein the molar ratio of strontium to alpha-ketoglutaric acid may be 1:1. A more specific example comprises reacting alpha-ketoglutaric acid with strontium hydroxide and/or strontium oxide, wherein the molar ratio of strontium to alpha-ketoglutarate optionally may be 1:1. Yet another example of such a process comprises reacting strontium metal with alpha-ketoglutaric acid. As disclosed in examples 4-7 the invention also relates to specific methods of producing the strontium salt of the invention involving synthesis at temperatures above 100 °C.

35 The invention also relates to a method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as the ones mentioned above, for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof an amount of the

strontium alpha-ketoglutarate salt according to the invention.

In the latter method wherein strontium alpha-ketoglutarate is administered, the salt may be administered in a dose corresponding to from about 0.1 to about 17 g daily calculated as anhydrous salt. More specifically, the salt may be administered in a dose  
5 corresponding to from about 0.2 to about 15 g daily such as, e.g., from about 0.4 to about 13 g daily, from about 0.6 to about 12 g daily or from about 0.7 to about 11.5 g daily calculated as anhydrous salt.

10 As described above, depending on the condition the subject is having, there might be a need for increasing and/or adjusting the amounts of strontium and alpha-ketoglutarate administered. Thus, the invention further relates to a method, which comprises the administration of an additional dose of a strontium-containing compound and/or an additional dose of an alpha-ketoglutarate-containing compound together with strontium  
15 alpha-ketoglutarate. The strontium-containing and alpha-ketoglutarate containing compounds may be selected from the compounds described above.

For the method wherein the strontium alpha-ketoglutarate salt is administered, optionally together with an additional amount of strontium and/or alpha-ketoglutarate, and the  
20 method wherein one or more strontium-containing compounds and one or more alpha-ketoglutarate-containing compounds are administered, the weight ratio between the total daily dose of strontium and the total daily dose of alpha-ketoglutarate may be from about 0.01 to about 4, such as, e.g., from about 0.01 to about 4, from about 0.01 to about 2, from about 0.01 to about 1, from about 0.01 to about 0.6, from about 0.03 to about 4, from  
25 about 0.03 to about 2, from about 0.03 to about 1, from about 0.1 to about 2, from about 0.1 to about 1, from about 0.15 to about 0.5, about 0.2 to about 2, from about 0.3 to about 2 or from about 0.4 to about 2.

The daily dose of alpha-ketoglutarate may be at least about 0.5 g, such as, e.g., at least  
30 about 1.0 g, at least about 1.5 g, at least about 2.0 g, at least about 2.5 g, at least about 3.0 g, at least about 4 g, at least about 5 g or from about 0.5 g to about 10 g, from about 0.5 g to 7 g, from about 2 g to about 10 g or from about 2 g to about 7 g.

In a method according to the invention, the strontium component and the alpha-  
35 ketoglutarate component may be administered in single compositions or simultaneously in separate, co-administered compositions. Strontium and alpha-ketoglutarate may be in the form of strontium alpha-ketoglutarate, optionally with an additional amount of a strontium-

containing compound and/or an alpha-ketoglutarate-containing compound. The additional component may be added to the strontium alpha-ketoglutarate in the same composition, or may be in a separate composition intended for simultaneous administration.

- 5 Strontium and alpha-ketoglutarate may also be combined as a mixture of one or more strontium-containing compounds and one or more alpha-ketoglutarate-containing compounds in the same formulation, or in separate forms intended for simultaneous administration. When two or more separate formulations are being co-administered, each formulation, especially those for use by oral route, may be color-coded or otherwise easily  
10 identifiably labeled in order to avoid confusion by the subject or physician.

In another method according to the invention, the administration of the strontium component and the alpha-ketoglutarate component may take place sequentially.

- 15 The invention also relates to a kit for use in the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism,  
20 periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic  
25 bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a  
30 second component, the first component comprising strontium alpha-ketoglutarate and one or more second components comprising at least one of the following: i) a further strontium containing compound, ii) a further alpha-ketoglutarate containing compound, iii) a calcium containing compound, iv) a further active substance, such as, e.g. vitamin D.
- 35 The invention also relates to a kit for use in the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a

child, such as, e.g., such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hyper-calcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions  
5 produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis  
10 pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a further strontium containing  
15 compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) a further active substance, and one or more second components comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a further strontium containing compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) a further active substance, such as, e.g. vitamin D,  
20 with the proviso that the first and the one or more second components are not identical.

The strontium- and alpha-ketoglutarate-containing compounds for use in the kits may be selected from the compounds mentioned above.

#### 25 *Strontium/glutamate compositions*

As mentioned above alpha-ketoglutarate may be converted to the amino acid glutamate, which is a precursor of glutamine, arginine and proline, the latter being an important component of collagen. Thus, the amino acid glutamate is also considered an important agent in the treatment of cartilage and/or bone condition, and the administration of  
30 strontium and glutamate together in the form of a strontium glutamate salt is believed to have prophylactic and/or therapeutic value in that one or more of the beneficial effects mentioned above for strontium and alpha-ketoglutarate can be obtained. In addition glutamate may directly affect specific glutamate receptors present on the resorbing osteoclasts, and thus affect the metabolic activity and bone resorbing action of these cells.

35

Thus, the present invention relates to the use of a strontium glutamate salt of the formula II:

as a medicine as well as to a method for the preparation of strontium glutamate. As  
5 disclosed in examples 4-7 the invention also relates to specific methods of producing the strontium salt of the invention involving synthesis at temperatures above 100 °C.

The invention further relates to use of strontium glutamate for the preparation of a  
pharmaceutical composition for the treatment and/or prophylaxis of a cartilage and/or  
10 bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as described herein before.

For the treatment and/or prophylaxis of different cartilage and/or bone diseases, the  
15 possibility of administering various amounts of strontium and glutamate respectively may be desired. The amount of strontium and glutamate in a pharmaceutical composition according to the invention may be adjusted by adding an additional amount of strontium in the form of a strontium-containing compound and/or an additional amount of glutamate in the form of a glutamate-containing compound to the composition.

20 All the strontium salts of organic or inorganic acids mentioned above and salts of glutamic acid may be used to adjust the amount of strontium and glutamate in a pharmaceutical composition comprising strontium glutamate, and may also be used in a composition according to the invention comprising a strontium-containing compound and a glutamate-  
25 containing as described above. The salts may be in hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or polymeric form.

The organic and inorganic acids for making strontium salts may be selected from any of the groups described above.

30 Below follows examples of salts of glutamic and aspartic acid, which may be used to adjust the amount of glutamate and/or aspartate compound in a pharmaceutical composition comprising strontium glutamate and/or strontium aspartate, or in a pharmaceutical composition comprising a strontium-containing compound and a  
35 glutamate compound as described above.

The salt may be a salt of an alkali metal, a mixed salt of alkali metals, an alkaline earth metal, or mixtures thereof.

Specific examples of salts for use according to the invention may be sodium glutamate, potassium glutamate, lithium glutamate, magnesium glutamate, calcium glutamate. The salt may also be a salt of an amine or an amino acid or an ammonium salt or mixtures thereof. The amine may be selected from methyl amine, ethyl amine, propyl amine, isopropyl amine and butyl amine, and the amino acid may be selected from arginine, ornithine, lysine and histidine.

10

The invention also relates to a method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as the ones mentioned above, for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof an amount of the strontium glutamate salt according to the invention.

In the latter method wherein strontium glutamate is administered, the salt may be administered in a dose corresponding to from about 0.2 to about 28 g daily calculated as anhydrous salt. More specifically, the salt may be administered in a dose corresponding about 0.3 to about 25 g daily such as, e.g., from about 0.7 to about 20 g daily, from about 1 to about 17 g daily or from about 1.2 to about 16 g or from about 2 to about 6 g daily calculated as anhydrous salt.

25

As described above, depending on the condition the subject is having, there might be a need for increasing and/or adjusting the amounts of strontium and glutamate. Thus, the invention further relates to a method, which comprises the administration of an additional dose of a strontium-containing compound together with strontium glutamate. The invention also relates to a method, which comprises administration of an additional dose of a glutamate-containing compound. The strontium-containing and glutamate-containing compounds may be selected from the compounds described above.

30

For the method wherein a strontium glutamate salt is administered, optionally together with an additional amount of strontium and/or L- or D-glutamate, and the method wherein one or more strontium-containing compounds and one or more L- or D-glutamate-containing compounds are administered, the weight ratio between the total daily dose of

35

strontium and the total daily dose of glutamate is from about 0.01 to about 4, such as, e.g., from about 0.01 to about 4, from about 0.01 to about 2, from about 0.01 to about 1, from about 0.01 to about 0.6, from about 0.03 to about 4, from about 0.03 to about 2, from about 0.03 to about 1, from about 0.1 to about 2, from about 0.1 to about 1, from about 0.15 to about 0.5, from about 0.2 to about 2, from about 0.3 to about 2 or from about 0.4 to about 2.

As mentioned above, the daily dose of strontium may be at least about 0.01 g, such as, e.g., at least about 0.025 g, at least about 0.050 g, at least about 0.075 g, at least about 0.1 g, at least about 0.2 g, at least about 0.3 g, at least about 0.4 g or at least about 0.5 g or from about 0.01 g to about 2 g such as, e.g., from about 0.1 g to about 2 g, from about 0.3 g to about 2 g or from about 0.3 g to about 1 g.

The daily dose of L- and/or D-glutamate may be at least about 0.5 g, such as, e.g., at least about 1.0 g, at least about 1.5 g, at least about 2.0 g, at least about 2.5 g, at least about 3.0 g, at least about 4 g, at least about 5 g or from about 0.5 g to about 10 g, from about 0.5 g to 7 g, from about 2 g to about 10 g or from about 2 g to about 7 g.

The invention also relates to a method wherein the strontium component and the glutamate component are administered in the form of a pharmaceutical composition as described above.

In a method according to the invention the strontium component and the glutamate component may be administered in single mixture formulations or simultaneously in separate, co-administered formulations. Strontium and glutamate may be in the form of strontium glutamate, optionally with an additional amount of a strontium-containing compound and/or a glutamate-containing compound. The additional component may be added to the strontium glutamate in the same formulation, or may be in a separate formulation intended for simultaneous or sequential administration.

Strontium and glutamate may also be combined as a mixture of one or more strontium-containing compounds and one or more glutamate-containing compounds in the same formulation, or in separate forms intended for simultaneous administration. When two or more separate formulations are being co-administered, each formulation, especially those for use by oral route, may be color-coded or otherwise easily identifiably labeled in order to avoid confusion by the subject or physician.

As described above one or more active substances may be added to a pharmaceutical composition according to the invention or administered as part of the same treatment as the administration of strontium and glutamate.

5 *Strontium/aspartate compositions*

Aspartate is an amino acid structurally related to glutamate, which can also form pharmaceutically relevant salts in complex with strontium. As all amino acids except glycine aspartate exist in an L-form, which is the physiologically relevant form used in all biological systems and the 'mirror image' enantiomer denoted D-Aspartate. D-aspartate  
10 may directly or indirectly affect metabolism of bone and/or cartilage via binding to the N-methyl-D-aspartate (NMDA) receptor, which has been found on metabolically active osteoclasts and may also be present on chondrocytes of articular cartilage. Thus the present invention also relates to a strontium aspartate salt (in D- or L- form or a mixture thereof) of the formula (III)

15

as a medicine as well as to a method for the preparation of strontium aspartate. As disclosed in examples 4-7 the invention also relates to specific methods of producing the  
20 strontium salt of the invention involving synthesis at temperatures above 100 °C.

The invention further relates to use of strontium aspartate for the preparation of a pharmaceutical composition for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone  
25 metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., male and female osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions  
30 produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis  
35 pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain. The

pharmaceutical composition may further comprise one or more physiologically acceptable excipients.

- The invention also relates to a kit for use in the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising strontium glutamate and one or more second components comprising at least one of the following: i) a further strontium containing compound, ii) a further glutamate containing compound, iii) a calcium containing compound, iv) vitamin D, v) parathyroid hormone, vi) a further active substance.
- The invention also relates to a kit for use in the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic

fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a further strontium containing compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, and one or more second components comprising at least one of the following: i) strontium glutamate, ii) a further strontium containing compound, iii) a further glutamate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, with the proviso that the first and the one or more second components are not identical.

#### *Pharmaceutical compositions*

The pharmaceutical compositions according to the invention normally comprise the specific compounds together with one or more physiologically acceptable excipients, i.e. a therapeutically inert substance or carrier.

The carrier may take a wide variety of forms depending on the desired dosage form and administration route.

20

The pharmaceutically acceptable excipients may be e.g. fillers, binders, disintegrants, diluents, glidants, solvents, emulsifying agents, suspending agents, stabilizers, enhancers, flavors, colors, pH adjusting agents, retarding agents, wetting agents, surface active agents, preservatives, antioxidants etc. Details can be found in pharmaceutical handbooks such as, e.g., Remington's Pharmaceutical Science or Pharmaceutical Excipient Handbook.

Above are mentioned specific examples of the amounts of compounds administered. However, it will be understood that the amount of the compounds actually administered will be determined by a physician in light of the relevant circumstances including the condition to be treated, the choice of compounds to be administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms and the chosen route of administration. While the present compounds are preferably administered orally, the compounds may also be administered by any other suitable route.

35

The pharmaceutical composition comprising a compound according to the invention may be in the form of a solid, semi-solid or fluid composition.

The solid composition may be in the form of tablets such as, e.g. conventional tablets, effervescent tablets, coated tablets, melt tablets or sublingual tablets, pellets, powders, granules, granulates, particulate material, solid dispersions or solid solutions.

5

In one embodiment of the invention, the pharmaceutical composition may be in the form of a tablet. The tablet may be coated with a coating that enables release of at least part of the salt in the proximal part of the small intestine, such as e.g. the duodenum and/or the proximal jejunum, such as at least 50% w/w, at least 60% w/w, at least 65% w/w, at least  
10 70% w/w, at least 80% w/w or at least 90% w/w of the total amount of the salt contained in the tablet.

The tablet may have a shape that makes it easy and convenient for a patient to swallow. The tablet may thus e.g. have a rounded or a rod-like shape without any sharp edges.

15 Furthermore, the tablet may be designed to be divided in two or more parts.

A semi-solid form of the composition may be a paste, a gel or a hydrogel.

The fluid form of the composition may be a solution, an emulsion including nano-  
20 emulsions, a suspension, a dispersion, a liposomal composition, a spray, a mixture, a syrup or an elixir.

Other suitable dosage forms of the pharmaceutical compositions according to the invention may be capsules, sachets, troches, devices etc.

25 The pharmaceutical compositions may be prepared by any of the methods well known to a person skilled in pharmaceutical formulation.

#### *Other aspects of the invention*

As mentioned above, use of a composition or kit according to the invention may lead to  
30 improved fracture healing after traumatic or atraumatic fracture, where the fracture e.g. may be one of the following traumatic or atraumatic fractures: fracture to the distal radius, such as e.g. a Colle's fracture or a Smiths fracture, a fracture of the femur, such as e.g. the proximal femur, such as e.g. a cervical fracture, a trochanteric fracture or a subtrochanteric fracture.

35

The improved fracture healing may be defined in terms of a reduction of the time a patient will require a plaster, reduction of the time to healing as defined on a X-ray, reduction in

the time to fracture stability, improvement of callus formation as viewed by X-ray, reduction in time before appearance of callus formation as viewed by X-ray and/or reduction in time for regaining full or near-full mobility or physical activity level.

- 5 Other embodiments of the invention appear from the appended claims. The details and particulars described above and relating to the compounds and compositions according to the invention apply *mutatis mutandis* to the other aspects of the invention.

#### Legends to figures

- 10 Figure 1: Molecular structure of strontium L-glutamate ( $6\cdot\text{H}_2\text{O}$ ) in the crystalline form as disclosed by Schmidbaur et al 1989. The crystal is shown with atoms depicted as ellipsoids (defined at the 50% probability level according to the ORTEP program (Oak Ridge Thermal Ellipsoid Plot Program)). Complexation by  $\text{Sr}^{2+}$  by three additional symmetrically related amino acids is indicated only by the coordinating carboxy oxygen atoms O1, O2 and O3/O4.

Figure 2: Extended layer structure of strontium L-glutamate ( $6\cdot\text{H}_2\text{O}$ ) in the crystalline form as disclosed by Schmidbaur et al 1989. Strontium atoms are shown as gray and interstitial water molecules as black.

20

- Figure 3: Molecular structure of strontium L-aspartate ( $3\cdot\text{H}_2\text{O}$ ) in the crystalline form as disclosed by Schmidbaur et al 1990. The crystal is shown with atoms depicted with arbitrary radii. Complexation by  $\text{Sr}^{2+}$  by four additional symmetrically related amino acids is indicated only by the coordinating carboxy oxygen atoms O3'/O3'' and O4''/O4'''.
- 25 Complexation to oxygen atoms of two water molecules are visible as O6 and O7.

Figure 4: Diffractograms of the x-ray analysis of two strontium salts. The top diffractogram shows Strontium glutamate hexahydrate, as synthesised by strontium hydroxide and L-glutamic acid at high temperature but using the reaction conditions described in example 2.

30

Figure 5. X-ray diffractogram of crystals of strontium glutamate hexahydrate prepared by the method as described in example 7.

- Figure 6. X-ray diffractogram of crystals of strontium malonate prepared by the method as described in example 7. The malonate salt of strontium have not previously been characterized and comprise a new crystallographic structure, but it is apparent from the
- 35

stable baseline, and well defined spacing of diffraction peaks, that the crystal form of the malonate salt is homogeneous and pure.

Figure 7. Results of the optimisation experiments for strontium glutamate synthesis outlined in table 9. The influence on the yield of the synthesis of strontium glutamate was investigated by varying four parameters. (Yields above 100% indicate incomplete drying).

Figure 8 (previous page): Plot of serum strontium concentrations measured in rats given a single dose of strontium as indicated in the upper part of each panel. The data points represent mean and standard deviation for each measuring point. Pre-dosis represent corresponding samples taken from animals treated with vehicle alone.

Figure 9. Modelling of theory (solid line) to experimental data (diamonds) of strontium with error bars superimposed. The theory fits the data excellently and the area under the curves (AUC) are calculated by the model. The strontium content always peaked after 60 min. but the second peak defined by the rate of metabolism vary between the salts. In the present examples, the Sr- $\alpha$ -ketoglutarate is quickly metabolised while Sr-glutamate rests longer in the serum.

The invention is further illustrated in the examples that are not intended to limit the invention in any way.

### Examples

#### Example 1

**General method for preparation of crystalline salts of strontium by precipitation from dissolved strontium chloride and dissolved sodium salts of the appropriate carboxylic anions**

In a glass-beaker of 100 mL volume, 5 g of the sodium salt of the carboxylic acid was dissolved in a small volume of water that was slightly heated at temperatures not greater than 30-50 °C. The final volume was 25-50 mL. In another beaker 10 g of SrCl<sub>2</sub> (SrCl<sub>2</sub> hexahydrate, Sigma-Aldrich 43,966-5) was dissolved in 100 mL of water. This latter solution was slowly decanted into the first solution of the dissolved sodium salt. The transfer continued until an initial cloudiness was observed, which resulted in a total volume of 50-100 mL. The solution was allowed to rest at room temperature (22-24 °C) for several days until significant amounts of crystallized precipitate of the organic strontium salt appeared.

The reaction that proceeds is exemplified by the reaction between strontium ions and sodium fumarate (reaction schemes (a) and (b)):

In order to accelerate the crystallisation, we have found that addition of small volumes of ethanol, such as from 5 – 10 vol/vol % to 50 – 60 % vol/vol induces a significant  
 10 acceleration of the precipitation of the desired strontium salt. Addition of ethanol is of special importance in the synthesis of strontium salts with solubility exceeding 2 g/l at room temperature (22-24 °C), and will thus provide a substantial benefit for the synthesis of strontium salts of L-aspartate, L-glutamate and lactate. In order to reach the required product within a short period, it was essential to observe an initial crystallisation or an  
 15 initial dimness in the solution right from the first stage.

After the precipitation, the solution was filtered on a Büchner funnel using a suction flask and the crystals were flushed in small volumes of ethanol. Crystals of some of the salts were very soluble, so in order to improve the yield of crystals, the solution was allowed to  
 20 rest longer, such as at least 30 – 60 min. Repeated crystallisation resulted in yields of approx. 50%. Strontium salts of L-aspartate and of lactate were very soluble, with solubility exceeding 25 g/l in water at room temperature.

The lactate and L-glutamate salts of strontium were precipitated from solutions with an  
 25 excess of strontium chloride and large crystals of the lactate salt were achieved by slow evaporation of the solvent.

### Example 2

**General method for preparation of crystalline salts by neutralisation of carboxylic  
 30 acids with strontium hydroxide**

A small amount of the organic acid proper (0.75 – 3 g, see table below) was dissolved in water by heating to temperatures between 30°C – 50 °C. Then, strontium hydroxide (Sigma Aldrich,  $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ , MW 265.71, CAS no. 1311-10-0, approx. 10 g/L) was slowly added. Then, a magnetic stirring rod was added and the stirring and gentle heating  
 35 (i.e. 30 – 50°C) of the suspension was started. After some time, the solution clarifies and all the solid material dissolves. The heating is maintained, and after three hours of

Incubation, the solution is filtered while hot on a Büchner funnel. Very small amounts of impurities were left in the filter.

The filtrate was subsequently allowed to cool at room temperature overnight, which  
 5 resulted in growth of fine-powdered crystals of the desired strontium salt. Further purifications of the salts can be performed by repeated re-crystallizations (table 6).

Strontium salt of (free acid used):	Sr(OH) <sub>2</sub> *8H <sub>2</sub> O	Free acid	Amount obtained	Recovery*	Melting Temp.	Solubility	Crystal structure
Fumarate <sup>1</sup>	2.044 g	1.140 g	0.999 g	99 %	>380°C	Yes	No
α-ketoglutarate <sup>2</sup>	2.017 g	1.441 g	0.828 g	72 %	>380°C	Yes	No
succinate	2.098 g	1.177 g	0.958 g	92 %	230°C	Yes	Yes
L-Ascorbate <sup>3</sup>	2.094 g	1.805 g	2.005 g	15 %	>380°C	Yes	No
L-Glutamate	2.017 g	1.453 g	0.175 g	15 %	>380°C	Yes	Yes
Citrate	2.057 g	1.918 g	1.123 g	48 %	>380°C	Yes	Yes
D-Aspartate	2.190 g	1.316 g	0.167 g	14 %	>380°C	No	No
Tartrate	2.070 g	1.502 g	2.005 g	129 %	>380°C	Yes	Yes

Table 6: Amounts of start reagent used for organic strontium salt synthesis and recoveries  
 in the synthesis of eight specific organic strontium salts following the general reaction  
 10 pathway with free-acid forms of the anion, and strontium hydroxide

#### Notes

\*) Recovery calculated in-% of the strontium content in Sr(OH)<sub>2</sub>\*8H<sub>2</sub>O.

1) Fumaric acid is insoluble in water, and ethanol is added to the suspension until  
 15 complete solubilization is achieved. The synthesis is continued with this material.

2) The strontium-AKG salts has a slight brownish appearance and a melting temperature  
 %

3) In addition to the indicated amounts of strontium hydroxides and L-ascorbate an  
 additional 4.087g SrCl<sub>2</sub>\*6H<sub>2</sub>O solubilized in water is added to the reaction mixture.

20

#### **Example 3**

##### **Determinations of solubility of organic strontium salts**

##### *Synthesis of strontium salts*

25 The great majority of strontium salts could be obtained by reacting the sodium salt of the organic acid with strontium chloride following the general synthesis method described in example A. However, strontium citrate, strontium tartrate, strontium succinate and

strontium  $\alpha$ -ketoglutarate for the solubility investigations was obtained by synthesis from the free acid forms of the carboxylic acid and strontium hydroxide as described in example 2. Strontium glutamate was obtained as described in example 4, using an incubation temperature of 100°C and using strontium chloride and L-glutamic acid for the synthesis for obtaining pure and homogeneous hexahydrate crystals of strontium glutamate. As described in example 4 the strontium glutamate salt obtained by this method is distinct from a previously described form of crystalline strontium L-glutamate. Detailed investigations of solubility were carried with the strontium salts listed in table 7:

10

Strontium salt	MW	% Sr
Sr-ranelate (*7H <sub>2</sub> O)	639.6	27.4
SrCl <sub>2</sub> (*6H <sub>2</sub> O)	266.6	32.9
Sr-fumarate (*6H <sub>2</sub> O)	309.7	28.3
Sr-L-glutamate (*6H <sub>2</sub> O)	340.7	25.7
Sr- $\alpha$ -ketoglutarate (*6H <sub>2</sub> O)	339.7	25.8
Sr-aspartate (*3H <sub>2</sub> O)	272.7	32.1
Sr-succinate (*6H <sub>2</sub> O)	311.7	28.1
Sr-ascorbate (*6H <sub>2</sub> O)	545.8	16.1
Sr-malenate (*6H <sub>2</sub> O)	309.7	28.3
Sr-malonate (*1H <sub>2</sub> O)	207.7	42.2
Sr-pyruvate (*6H <sub>2</sub> O)	369.7	23.7
Sr-tartrate (*6H <sub>2</sub> O)	343.7	25.5
Sr-citrate (*6H <sub>2</sub> O)	749.1	35.1

Table 2: Overview of strontium salts used in investigation of solubility. MW indicates the molecular weight of the homogeneous crystalline form of the salt with the indicated amount of crystal water and % Sr gives the molar percentage that strontium constitutes of this crystalline form

The solubility of the organic carboxylic acid strontium salts, were measured in water. The solubility of these salts was also measured as a function of temperature. This was performed by incubating the saturated solutions of the salts in temperature-controlled incubators. Furthermore the solubility of the salts was studied in pure distilled water as well as a 0.05 M ammonium carbonate buffered solutions, with a physiological pH of 7.5.

The buffered solutions were immersed into a bath of water temperature controlled at either room temperature (22 – 24 °C), at 30 °C or at 40 °C. The test tubes were stirred and the solutions were subsequently incubated in an incubator with constant temperature for 24 hours. In order to eliminate any reminiscent strontium chloride influence on the

determination of solubility, all the precipitate was collected at the bottom of the test tubes and the solutions above the precipitate were carefully removed and substituted by fresh solutions. After substitution of the solutions, the test tubes were stirred again and allowed to rest for another 24 hours. From these solutions, the dissolved proportions of the  
5 strontium salt were collected in volumes of 1 mL at the specified temperature. The solutions were diluted to 50 mL before analysis by Flame Atomic Absorption Spectrometry (F-AAS). Before subsequent series of sampling, the solutions were equilibrated at the next temperature for 24 hours.

#### 10 *Analysis of Strontium by flame atomic absorption spectrometry F-AAS*

Two methods were used for quantification of strontium in solutions: Flame Atomic Absorption Spectrometry (F-AAS), and the more sensitive inductively-coupled-plasma-mass spectrometry (ICP-MS). For most investigations, the F-AAS method had sufficient sensitivity.

15

Some of the very soluble strontium salts were further diluted before analysis by F-AAS. The measurements were performed by using a Perkin-Elmer 2100 equipped with a hydrogen lamp for correction of the background signal. Strontium was measured at a slit width of 0.2 nm, the wavelength was 460.8 nm operated at an energy of 58 and a current of

20 8 mA.

#### *Temperature and pH influence on organic strontium salt solubility*

For the majority of the organic strontium salts listed in table 2, temperature changes in the interval from 20 – 40 °C had only little influence on solubility (table 3). However, for  
25 strontium L-glutamate a significant influence of temperature on solubility was observed in the range between 20 °C and 40 °C. The solubility of this salt increased more than three-fold in the investigated interval in contrast to most other salts. It is noted, that the solubility under physiological conditions (37 °C), is of relevance for the pharmaceutical use of the substances, and thus the surprising increase in strontium glutamate solubility at higher  
30 temperature may have great potential therapeutic implications.

The solubility of the strontium salts in an ammonium carbonate buffered solution of pH 7.5 was generally higher than the solubility determined in pure water (table 8). However, there were some notable exceptions, such as strontium maleate, which had decreased solubility  
35 in the buffered solution. Accordingly, it was found most relevant to compare the solubility of the strontium salts by comparing the values obtained in water, as shown in table 8.

*Relative solubility*

The water-solubilities of the organic strontium salts at room temperature and at 40 °C, are listed in table 8. The strontium salts of L-aspartate and of lactate had solubilities exceeding 50 g/l hampering exact determination of solubility with the employed

5 experimental procedures.

The results correspond to the observations during the synthesis experiments where the citrate, the fumerate and the tartrate precipitated instantly when synthesized by the production procedures described in examples 1 and 2. This is indicative of a poor solubility of these strontium salts, as apparent by the lower solubility of these salts

10 compared to the other organic strontium salts at both 22 °C and 40 °C.

The glutamate salt showed a higher solubility than the other salts, especially at a temperature of 40 °C. During the synthesis of this salt, it was necessary to add alcohol to the solution, to initiate crystal growth, indicative of relatively high water solubility. The

15 other studied strontium salts only precipitated after evaporation of the solvent for a few days at room temperature, but addition of alcohol was not required to initiate crystal formation and precipitation.

STRONTIUM SALT	SOLUBILITY AT ROOM TEMPERATURE (22 – 24°C) (mg/L)		SOLUBILITY AT 40°C (mg/L)	
	In water	pH 7.5	In water	pH 7.5
Anion				
Malonate**	1474	2816	1441	2127
L-glutamate**	2111	3022	7093	7195
L-aspartate**	4200		7900	
Pyruvate*	2204	1946	1929	1829
α-ketoglutarate**	1316	2252	3534	3809
Fumerate**	571	1215	444	977

**Example 4****Preparation of strontium glutamate hexahydrate by synthesis at 100°C**

- Initially, a suspension of glutamic acid (white colored) is prepared by adding 100 mL of  
5 millipore water to 14.703 g (0.1 moles) of solid L-glutamic acid (Sigma Aldrich,  $C_5H_9NO_4$ ,  
MW 187.14 g/mole, CAS no. 142-47-2, lot. no. 426560/1, filling code 43003336) in a 250  
mL beaker. To this suspension was added 26.66 g (0.1 moles) of solid  $SrCl_2$  ( $SrCl_2$   
hexahydrate, Sigma-Aldrich 43,966-5, MW 266.6). Then, a magnetic stirring rod was  
added and the stirring and heating was started to the point of boiling of the suspension.  
10 The final suspension is also white colored and the stirring is sustained by maintaining a  
medium rotation rate of the stirring apparatus. In order to prevent carbon dioxide from  
entering the solution, the beaker was covered by a covering glass.
- After some minutes of boiling and stirring, the solution clarified and all the solid material  
15 dissolved. The boiling was maintained, and additional water was added when required, as  
to replace the water lost by boiling. After three hours of boiling, the solution was filtered  
while boiling on a Büchner funnel. Very small amounts of impurities were left in the filter.  
The filtrate was subsequently allowed to cool to room temperature, which resulted in  
growth of fine-powdered crystals of strontium glutamate hexahydrate. Precipitation of the  
20 final product progressed in the filtrate within an hour. The product was filtered and dried at  
110 °C in an oven for ½ hour followed by drying 12 hours in a dessicator over silica  
orange. Before analysis by x-ray crystallography and by FAAS, the salts were ground to  
fine powder by a mortar.
- 25 The X-ray crystallographic analysis (figure 4) revealed that the synthesized strontium  
glutamate salt was distinct from the previously described strontium L-glutamate  
hexahydrate salt described in figures 1 and 2 and tables 2 and 3.
- This salt and the resulting diffractogram corresponds to the strontium L-glutamate  
30 hexahydrate salt previously described (H. Schmidbaur, I. Bach, L. Wilkinson & G. Müller  
(1989), Chem Ber. 122; 1433-1438) and further detailed in figure 1 and 2 and table 2 and  
3. The lower trace shows a strontium glutamate hexahydrate salt synthesized from  
strontium chloride and L-glutamic acid as disclosed in the present example.
- 35 The total yield of strontium glutamate hexahydrate was approximately 92% before  
recrystallisation, and the majority of impurities consisted of reminiscences of the reagents and  
of strontium carbonate. This yield is significantly higher than the yield obtained by

synthesis under conventional conditions where only 15 % was obtained (please see example 2). Thus, the high temperature synthesis method as disclosed in this patent provides a significant gain in yield and a reduction in synthesis time, while resulting in a strontium glutamate salt of higher purity. Furthermore, the strontium glutamate obtained by this synthesis procedure was distinct from the strontium L-glutamate hexahydrate salt previously described (H. Schmidbaur, I. Bach, L. Wilkinson & G. Müller (1989), Chem Ber. 122; 1433-1438). The strontium glutamate hexahydrate described previously in the literature by Schmidbaur et al was reported to have very low solubility (0.023 g/l), whereas the strontium glutamate salt prepared by the method disclosed in the present example had a solubility above 2 g/l. This later parameter is very important for potential medical use of the strontium salt as described in the present invention.

Further improvements of the synthesis may include degassing by nitrogen or by argon of the water and of all aqueous solutions, which prevents contact to carbon dioxide that eventually may lead to formation of impurities of strontium carbonate. It follows that a person skilled in the art will easily be able to adapt the procedure to proceed under an inert gas atmosphere.

#### Example 5

##### 20 Preparation of strontium aspartate trihydrate by synthesis at 100 °C

Initially, a suspension of aspartic acid (white colored) is prepared by adding 100 mL of millipore water to 13.311 g (0.1 moles) of solid L-aspartic acid (Fluka,  $C_6H_9NO_4$ , MW 133.11 g/mole, CAS no. 56-84-8, lot. no. 432866/1, filling code 52603495) in a 250 mL beaker. To this suspension was added 26.571 g (0.1 moles) of solid strontium hydroxide (Sigma Aldrich,  $Sr(OH)_2 \cdot 8H_2O$ , MW 265.71, CAS no. 1311-10-0). Then, a magnetic stirring rod was added and the stirring and heating was started to the point of boiling of the suspension. The final suspension is also white colored and the stirring is sustained by maintaining a medium rotation rate of the stirring apparatus. In order to prevent carbon dioxide from entering the solution, the beaker was covered by a covering glass.

30

After some minutes of boiling and stirring, the solution clarified and all the solid material dissolved. The boiling was maintained, and additional water was added when required, as to replace the water lost by boiling. After three hours of boiling, the solution was filtered while boiling on a Büchner funnel. Very small amounts of impurities were left in the filter.

35 The filtrate was subsequently allowed to cool to room temperature, which resulted in growth of fine-powdered crystals of strontium aspartate trihydrate. Precipitation of the final product progressed in the filtrate within an hour. The product was filtered and dried at 110

°C in an oven for ½ hour followed by drying 12 hours in a dessicator over silica orange. Before analysis by x-ray crystallography and by FAAS, the salts were ground to fine powder by a mortar.

- 5 The total yield of strontium aspartate trihydrate was approximately 98% before recrystallisation, and the majority of impurities consisted of reminiscences of the reagents and of strontium carbonate. This yield is significantly higher than the yield obtained by synthesis under conventional conditions where only 14 % was obtained (please see example 2). Thus the high temperature synthesis method as disclosed in this patent
- 10 provides a significant gain in yield and a reduction in synthesis time, while resulting in a strontium aspartate salt of higher purity. The product was unambiguously identified as strontium aspartate trihydrate by x-ray crystallography and comparing the data to results of the Cambridge Crystallographic Database and information from H. Schmidbaur, P. Mikulcik & G. Müller (1990), Chem Ber. 123; 1599-1602 as depicted in figure 3 and table 4
- 15 and 5 herein.

Further improvements of the synthesis may include degassing by nitrogen or by argon of the water and of all aqueous solutions, which prevents contact to carbon dioxide that eventually may lead to formation of impurities of strontium carbonate. It follows that a

20 person skilled in the art will easily be able to adapt the procedure to proceed under an inert gas atmosphere.

#### **Example 6**

##### **Preparation of strontium malonate monohydrate by synthesis at 100 °C**

- 25 Initially, a suspension of malonic acid (white colored) is prepared by adding 100 mL of millipore water to 10.406 g (0.1 moles) of solid malonic acid (Fluka, , MW 104.06 g/mole, CAS no. 141-82-2, lot. no. 449503/1, filling code 44903076) in a 250 mL beaker. To this suspension was added 26.571 g (0.1 moles) of solid strontium hydroxide (Sigma Aldrich,  $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ , MW 265.71, CAS no. 1311-10-0). Then, a magnetic stirring rod was added
- 30 and the stirring and heating was started to the point of boiling of the suspension. The final suspension is also white colored and the stirring was sustained by maintaining a medium rotation rate of the stirring apparatus. In order to prevent carbon dioxide from entering the solution, the beaker was covered by a covering glass.

- 35 After some minutes of boiling and stirring, the solution clarified and all the solid material dissolved. The boiling was maintained, and additional water was added when required, as to replace the water lost by boiling. After three hours of boiling, the solution was filtered

while boiling on a Büchner funnel. Very small amounts of impurities were left in the filter. The filtrate was subsequently allowed to cool to room temperature, which resulted in growth of fine-powdered crystals of strontium malonate. Precipitation of the final product progressed rapidly during filtration and the majority of the product was found in the filter (unheated). Only in rare instances, the precipitation progressed in the filtrate. The product was filtered and dried at 110 °C in an oven for ½ hour followed by drying 12 hours in a desiccator over silica orange. Before analysis by x-ray crystallography and by FAAS, the salts were ground to fine powder by a mortar.

10 The total yield of strontium malonate was approximately 98% before recrystallisation, and the majority of impurities consisted of remnants of the reagents and of strontium carbonate. The product was unambiguously identified as strontium malonate by x-ray crystallography and comparing the data to results of the Cambridge Crystallographic Database.

15

Further improvements of the synthesis may include degassing by nitrogen or by argon of the water and of all aqueous solutions, which prevents contact to carbon dioxide that eventually may lead to formation of impurities of strontium carbonate. It follows that a person skilled in the art will easily be able to adapt the procedure to proceed under an inert gas atmosphere.

20

#### **Example 7**

##### **Methods of manufacture of water soluble strontium salts of dicarboxylic acids using temperatures above 100 °C**

25 According to methods developed previously and described in examples 2 – 6, synthesis of strontium salts of dicarboxylic organic acids, and especially strontium salts of amino acids can be difficult to produce in larger scale (i.e. > 1 kg) due to low yields and difficulties in separating the desired reaction products from contaminants. Strontium salts of carbonate are of special concern as they will form as impurities when the reaction is occurring in atmospheric air containing normal levels of carbon dioxide. We have described in examples 4 – 6 that the total yield of the product when strontium salts of dicarboxylic acids are manufactured from the free acid form of the anion, and strontium hydroxide depends on temperature and on time of synthesis. In order for the reaction to reach completion, the mixture of the amino acid proper and strontium hydroxide needs boiling in water for three hours, allowing ample time for strontium in the reaction mixture to react with carbon dioxide in the air. In this example we disclose methods of improving the synthesis further

30

35

by providing optimized reaction conditions, where temperature is increased above 100°C in a closed container, and where reaction times are significantly reduced.

The present example provides representative data from the optimization of conditions for synthesis of strontium glutamate in an autoclave system. Strontium glutamate is used as an example, but the optimizations described in the example is also applicable for the synthesis of other strontium salts, where the exact reaction conditions can be optimized as disclosed in this example. The reaction temperatures must be maintained below the melting point or below the temperature of decomposition of the organic anion moiety of the desired strontium salt. As an example, malonic acid decomposes at 132-134 °C, and thus synthesis of strontium malonate must be performed at temperatures below 132°C.

Strontium L-glutamate was used as a model strontium compound in the optimisation experiments. The purity of the product was monitored by comparing to crystallographic data and by measuring the content of strontium. Ideally, the content of strontium is 25.7% in strontium L-glutamate hexahydrate, which is the product formed in these experiments. It follows that other soluble strontium salts may be prepared by similar methods with high yield and purity.

## 20 *Experimental*

Preparation of solutions: A suspension of glutamic acid (white coloured) is prepared by adding 100 mL of millipore water to 14.703 g (0.1 moles) of solid L-glutamic acid (Sigma Aldrich, C<sub>5</sub>H<sub>9</sub>NO<sub>4</sub>, MW 187.14 g/mole, CAS no. 142-47-2, lot. no. 426560/1, filling code 43003336) in a 250 mL beaker. To this suspension was added 22.257 g, 26.571 g or 31.885 (0.08 moles, 0.1 moles or 0.12 moles) of solid strontium hydroxide (Sigma Aldrich, Sr(OH)<sub>2</sub>·8H<sub>2</sub>O, MW 265.71, CAS no. 1311-10-0).

### *Optimisation experiments*

After preparation of the salts, the nine optimisation experiments were performed according to the settings of table 9.

Experiment no.	Autoclave temperature (°C)	Time of synthesis (min.)	Base-acid ratio	Total volume (ML)	Autoclave pressure (bar)	Yield%	%SR (AAS)
1	125	15	0,8	50	1,55	94	25
2	124	30	1	75	1	112	22
3	124	60	1,2	100	1,6	121	21

4	127	15	0,8	100	1,2	118	22
5	132	30	1	50	1,55	120	25
6	132	60	1,2	75	1,6	50	22
7	134	15	0,8	75	1,65	108	24
8	134	30	1	100	1,65	76	14
9	132	60	1,2	50	1,65	82	24

Table 9. Parameters and main results of the optimisation procedure for synthesis of strontium glutamate. The pressure was monitored but not used in the optimisation process. The strontium content (%Sr) was measured by FAAS but not used as quality parameter. The yield (%) was applied as the quality parameter.

#### *Procedure*

1. The calculated amount of acid was weighed and transferred to a bluecap autoclave bottle and the Millipore water was added. The bottle was closed and shaken, in order to obtain a finely grained suspension.
2. The calculated amount of strontium hydroxide octahydrate was weighed and added to the acid solution of (1) and the bottle was vigorously vortexed until all coarse lumps of material were transformed into fine-grained powder.
3. The bottle was placed in the autoclave and the temperature was set. While in the autoclave no additional stirring was carried out.
4. At  $t = 100^{\circ}\text{C}$  the valve of the autoclave was closed and the timing was started.
5. During the autoclaving were monitored the actual temperature and the actual pressure.
6. After the time of autoclaving ended, the steam was let out, as soon as possible, with due respect to safety precautions.
7. At approx.  $110^{\circ}\text{C}$  the autoclave was opened and the solution was recovered. Again, the bottle was shook, as to obtain a high degree of mixing.
8. The solution was immediately filtered hot on a Büchner funnel after autoclaving, which left only traces of carbonate in the filter. The product precipitated from the solution during cooling to room temperature.
9. After precipitation, the product was filtered and dried in an oven for  $\frac{1}{2}$  an hour at  $110^{\circ}\text{C}$ . Then, it was dried in an dessicator over silica-gel orange. Finally, the product was ground to fine powder in a mortar.
10. The product was weighed after grinding and the total yield calculated.

#### *Preparation of strontium malonate according to the invention*

In order to confirm the applicability of the disclosed high temperature synthesis method for other strontium salts than strontium L-glutamate, strontium malonate was prepared. Basically the reaction conditions found for preparation of strontium L-glutamate was employed. A suspension of malonic acid (white coloured) is prepared by adding 100 mL of  
5 millipore water to 10.41 g (0.1 moles) of solid malonic acid (FLUKA 63290, MW 104.1) in a 250 mL beaker. To this suspension was added 22.257 g, 26.571 g or 31.885 (0.08 moles, 0.1 moles or 0.12 moles) of solid strontium hydroxide (Sigma Aldrich,  $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ , MW 265.71, CAS no. 1311-10-0). The reaction procedure described above was followed, and the temperature was maintained below 130°C to avoid  
10 decomposition of malonic acid, while the reaction time was maintained at 15 min.

*Content of strontium (% Sr):*

A sample of 0.2 g was dissolved in 100 mL 0.1 M  $\text{HNO}_3$  prepared in Millipore water. This solution was further diluted by a factor of 500 by a solution of 1% KCl, and the content of  
15 strontium was determined by FAAS. The measurements were performed by using a Perkin-Elmer 2100 equipped with a hydrogen lamp for correction of the background signal. Strontium was measured at a slit width of 0.2 nm, the wavelength was 460.8 nm operated at an energy of 58 and a current of 8 mA.

20 *X-ray crystallography*

A second check of purity was performed by powder x-ray crystallography using a Huber G670 diffractometer. A characteristic diffractogram of the strontium glutamate is shown in fig. 5. An X-ray diffractogram of strontium malonate obtained by the high temperature synthesis method disclosed in the present example is shown in fig. 6. The double peak on  
25 the low angle side of the peak of maximum intensity observed in both figure 5 and 6 is an artefact of the instrument.

*Results and discussion*

In table 9, it is observed that some of the synthesis conditions resulted in relatively low  
30 yield and in strontium glutamate of low purity as apparent from the molar % of strontium in the reaction product. The product of experiment no. 8 was produced in relatively low yield, and it did not contain the expected 25.7% of strontium, which was also confirmed by the x-ray analysis. Despite this outlier, in general, the outcome of the optimisation experiments is close to the expected products. Incomplete reaction provides a product of too low  
35 content of strontium while formation of strontium carbonate during the synthesis gives a too high value of the strontium content. Conditions employed in experiments 1 and 5 gave the strontium content in best agreement with the expected value. Of notice, it is also

apparent although the product of experiment no. 6 was produced in low yield; it contained an amount of strontium that corresponded to the expected value.

By studying the influence of the individual parameters on the total yield (table 9 and fig. 7),  
5 It becomes clear that temperature, time of autoclaving and base-acid ratio are important for the synthesis while total volume is less important. A yield higher than 100%, which is observed in experimental conditions 2, 3, 4, 5 and 7 originates from incomplete drying, but this effect is almost eliminated when the average values are considered, as in fig. 7. Thus, the maximum yield was obtained by using a high temperature (133 °C), a short time of  
10 autoclaving (15 min.) and a surplus of strontium hydroxide. Accordingly, temperature is more important than time but it compares in importance to the base-to-acid ratio. However, great care must be exerted as to not exceed the temperature of decomposition in the synthesis of other strontium salts, which for, e.g., the malonate is 132-134 °C. A 10<sup>th</sup> experiment of control of optimisation was performed, as to confirm the maximum yield of  
15 the optimisation experiments.

Furthermore an additional experiment was performed to validate the applicability of the high temperature synthesis method for the preparation of other organic strontium salts than strontium L-glutamate. Strontium malonate was chosen, as this salt may be  
20 considered especially difficult to prepare under the high temperature conditions due to the low dissociation temperature of the malonic acid anion. However, as shown in figure 6, crystalline pure and well defined strontium malonate could easily be obtained. The crystal structure of the compound has not been completely resolved as it is a new structure not previously described, but the data shows that the high temperature method is likely to be  
25 applicable for many other organic strontium salts.

Further improvements of the synthesis include introduction of inert atmospheres to the synthesis environment, as well as degassing of all solutions by either nitrogen gas or by argon gas, as to reduce the formation of strontium carbonate.  
30

### *Conclusion*

The optimisation experiments show that it is possible to synthesize strontium glutamate in high yields by elevating the temperature to values above 100 °C, and by using a short time (15 min.) in the autoclave. Also, a 20% surplus of strontium-hydroxide also improves  
35 the total yield without compromising the purity of the synthesized strontium salt. A slightly more vigorous drying than silica-gel orange should be applied to the drying procedure in order to obtain completely dried product. Examples of more potent drying agents are

concentrated sulphuric acid or calcium oxide, but also conventional lyophilization or other mechanic treatments may be applicable for this procedure.

### Example 8

#### 5 Pharmacokinetic properties of dicarboxylic strontium salts

The aim of this experiment was to assess the bioavailability of dicarboxylic strontium salts compared with strontium chloride and strontium ranelate. The bioavailability was assessed by determination of serum strontium concentration at regular intervals over a 24 hour period and calculating AUC.

10

The experiment was performed with female SPF Wistar rats of the strain HanTac:WH (GALAS) from Taconic M&B A/S, Ejby, DK-4623 Lille Skensved, Denmark. At the start of the acclimatisation period, the rats were approximately 9 weeks old with a weight of approximately 200-250 g. The animals were housed in a room provided with filtered air at a temperature of  $21^{\circ}\text{C} \pm 3^{\circ}\text{C}$  and relative humidity of  $55\% \pm 15\%$  and a ventilation system providing 10 air changes per hour. The room was illuminated to give a cycle of 12 hours light and 12 hours darkness. The rats were fed a complete pelleted rodent diet "Altromin 1314" (Chr. Petersen A/S, DK-4100 Ringsted, Denmark). The rats had free access to bottles with domestic quality drinking water acidified with hydrochloric acid to pH 2.5 in order to prevent microbial growth.

15

The rats were randomly allocated randomly in seven groups of 9 animals treated as indicated in the table below. The groups, dose levels, animal numbers were as listed in table 10:

20

25

Dose <sup>1</sup> (mg /kg)	Group	Strontium salt	MW	% Sr	Dose Equivalent <sup>1</sup> (Amounts in mg)	Animal No's
Vehicle	Control	Vehicle (0.5 % CMC)	-	-	-	1-9
500	B	Sr-ranelate (*7H <sub>2</sub> O)	639.6	27.4	500 = 137 mg Sr <sup>++</sup>	10-18
416	C	SrCl <sub>2</sub> (*6H <sub>2</sub> O)	266.6	32.9	137 mg Sr <sup>++</sup> = 416	19-27
533	D	Sr-glutamate (*6H <sub>2</sub> O)	340.7	25.7	137 mg Sr <sup>++</sup> = 533	28-36
427	E	Sr-aspartate (*3H <sub>2</sub> O)	272.7	32.1	137 mg Sr <sup>++</sup> = 427	37-45
484	F	Sr-malenate (*6H <sub>2</sub> O)	309.7	28.3	137 mg Sr <sup>++</sup> = 484	46-54

325	G	Sr-malonate (*1H <sub>2</sub> O)	207.7	42.2	137 mg Sr <sup>++</sup> = 325	55-63
-----	---	-------------------------------------	-------	------	-------------------------------	-------

Table 10: The 7 treatment groups of the pharmacokinetic experiment. The doses administered in the group are listed in the first column, and salt, MW and Sr content in the middle columns.

- 5 <sup>1</sup> Doses are adjusted to provide equimolar strontium dose as 500 mg/kg Strontium-ranelate (heptahydrate)(group B).

The test article (strontium salt) was given once by oral gavage according to the most recent body weight data. The control group was dosed with the vehicle alone (0.5% carboxy methyl cellulose, CMC). The vehicle was prepared with de-ionized water for all treatment groups including controls. The test substances (strontium salts) were solubilized/suspended in a volume corresponding to 5 ml/kg body weight. In order to keep the compounds in suspension, the formulations were kept on a magnetic stirrer before and during dosing.

15

#### *Blood samples for toxicokinetics*

On the day of treatment (Day 1), blood samples were taken from all animals. Blood samples were collected from 3 animals per group at the following time points: Pre-treatment, and 30 min, 1, 1.5, 2, 4, 8 and 24 hours post-treatment, so that three animals from each group had samples taken at time 0, 1.5 and 6 hours, 3 other rats at time 0.5, 2, 8 hours and the remaining three animals in the group had samples taken at 1, 4 and 24 hours.

Approximately 0.5 – 0.6 ml blood was obtained at each time point from the orbital venous plexus into plain tubes for serum. The blood was kept at room temperature for 30 to 60 minutes and until centrifugation (10 min, 1270 G, +20 °C). The serum was transferred to Nunc cryotubes (Nunc, Denmark) and frozen at -18 °C for subsequent analysis of strontium content by graphite -furnace atomic-absorption spectrometry (GF-AAS).

#### 30 *Graphite-furnace atomic-absorption spectrometry (GF-AAS)*

Concentrated HCl was added to the serum samples to a final concentration of 0.2% HCl and the samples were then subjected to analysis using a Perkin-Elmer 2100 equipped with a hydrogen lamp for correction of the background signal. Strontium was measured at a slit width of 0.2 nm, the wavelength was 460.8 nm operated at an energy of 58 and a current of 8 mA.

*Results of the pharmacokinetic study of strontium salt absorption*

In figure 8, the serum concentration measured in the six groups treated with strontium salts are plotted as a function of the time after administration of the compounds. It is  
5 apparent that administration of the strontium salts results in a rapid and highly significant increase in serum strontium concentrations. When comparing the pharmaco-kinetic properties of different salts, it is apparent that both the highly soluble strontium chloride as well as the relatively poorly soluble strontium ranelate (see example 3), is rapidly absorbed, reaching a maximum serum concentration after approximately 2 hours.

10

The di-carboxylic acids with higher solubility, and especially the strontium salts of the amino acids L-aspartate and L-glutamate reach the maximal serum concentration with a slower kinetic rate and, with maximal concentration reached after approximately 8 hours. Furthermore, the serum strontium concentration in the time interval from 0 – 8 hours after  
15 the administration of the test substance appears more stable, at least for some of the di-carboxylic acids such as the aspartate and malonate salts of strontium. This pattern of two distinct peaks of maximal serum concentration is also apparent in the group treated with strontium malonate. It is likely to indicate that the strontium ion is taken up by two distinct absorption mechanisms, and that the highly soluble strontium salts according to the  
20 present invention may have particular potential to exploit the biphasic nature of the strontium uptake mechanism, and thus proved an overall benefit apparent as higher bioavailability of the strontium.

When AUC calculations were performed the general course of the curves, as evidenced  
25 by average values in fig. 8, was best described by modelling the response/pharmacokinetic curves in a specially developed mathematical model. In the initial step, it assumes that the strontium is not metabolised but simply transferred from the stomach/upper digestive tract of the rat into epithelial cells by an active transport mechanism. Also without metabolism, the strontium ion is then transferred from the  
30 stomach/upper digestive tract where it is simultaneously released to the blood vessels. Only during the circulation of strontium through the veins, the strontium is dispersed and metabolised by the body tissue. This credible but simplified description, thus includes a two-step mechanism of absorption of ionic strontium after oral administrations of the strontium ions, identified by the two peaks of fig. 9 at  $t = 60$  min and at  $t = 360$  min. After  
35 the strontium dose was administered to the rats, a characteristic time of uptake was found as  $t = 12$  min. The maximum content of strontium in the serum was observed after approx. 30 min. The characteristic time value of 12 min. is interpreted as the duration of strontium

ions being taken up by the active transport mechanism from the intestinal lumen and secreted into circulation. The time of strontium transfer between the stomach and the blood vessels is initiated almost instantly, while the time of transfer between the guts and the blood vessels proceeds at a later stage that depends on the type of salt investigated.

- 5 The malonate, in particular, exhibits a peak in the uptake-versus time from the guts to the blood vessels at  $t = 360$  min., as seen in fig. 8. Thus, the time of body metabolism of the malonate is very long, as compared to that of the other salts. For all salts, however, the strontium content levels out after approx. 1750 min. (29 hours) and approaches the natural level corresponding to the pre-dose level.

10

The model calculations (not shown) were applied to the determination of the areas under the curve that are shown in table 11. The standard deviations of the AUC values correspond to the general uncertainty on the measurements of fig. 8, and their magnitude does not allow for a significant discrimination between the salts. The AUC values of the

- 15 salts are much higher than the AUC value of the pre-dose samples.

ANION OF Sr-SALT	AUC $mg / L \cdot min$	STDDEV $mg / L \cdot min$
$\alpha$ -ketoglutarate	9000	1600
Aspartate	7000	1700
Chloride	7300	2000
Glutamate	10100	3100
Malonate	15000	8500
Pre-dose	168	67
Average	6800	5400

Table 11. Determination of the area under the curve according (AUC) to the model calculations.

- 20 These effects of delayed uptake of strontium and serum levels in a sustained level over longer time periods observed with strontium salts with di-carboxylic organic anions may enhance the pharmacological properties of the compounds. The delayed attainment of  $C_{max}$  may be an advantage for the use of the strontium compound in the treatment of diseases and conditions affecting bone metabolism. In these cases it is often an
- 25 advantage to administer the compound in the evening before bedtime, as this would allow the compound to act at night, when resorption of bone is occurring at the highest rate. Furthermore, the administration before bedtime minimizes the potential interference from calcium in the normal diet, as the pharmaceutical preparation of the strontium salt would be taken after the last meal. This is in contrast to administration during the day, where the
- 30 calcium content of normal meals would have the potential to interfere and reduce the

uptake of strontium. The gradual increase in serum strontium concentration over 4 – 8 hours after administration of the compound would comply well with evening administration of the compound and appears well suited to maximize the therapeutic effect of the strontium compound on bone metabolism.

In specific embodiments the invention relates to the following items:

1. A strontium salt of alpha-ketoglutaric acid of the formula I:

2. A salt according to item 1 in hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or polymeric form.

10 3. A salt according to item 1 or 2 for use as a medicine.

4. Use of a salt according to any of items 1-3, for the preparation of a pharmaceutical composition for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain.

15  
20  
25

5. A process for preparing a salt according to any of items 1-3, the process comprising reacting alpha-ketoglutaric acid with strontium hydroxide and/or strontium oxide.

30

6. A pharmaceutical composition comprising an amount of a salt according to any of items 1-3, together with one or more physiologically acceptable excipients.

35 7. A pharmaceutical composition according to item 6, further comprising an additional amount of a strontium-containing compound.

8. A pharmaceutical composition comprising a therapeutically and/or prophylactically effective amount of one or more first components containing a strontium compound and one or more second components containing an alpha-ketoglutarate compound, together with one or more physiologically acceptable excipients.
- 5
9. A pharmaceutical composition according to any of items 6-8, wherein the strontium-containing compound is selected from the group consisting of strontium salts of an organic or an inorganic acid.
- 10 10. A pharmaceutical composition according to item 9, wherein the inorganic acid is selected from the group consisting of hydrofluoric acid, hydrochloric acid, hydrobromic acid, hydroiodic acid, nitric acid, nitrous acid, phosphoric acid, phosphinic acid, phosphonic acid, sulfonic acid, sulfuric acid, sulfurous acid, disulfuric acid and boric acid.
- 15 11. A pharmaceutical composition according to item 9, wherein the organic acid is selected from the group consisting of acetic acid,  $C_2H_5COOH$ ,  $C_3H_7COOH$ ,  $C_4H_9COOH$ ,  $(COOH)_2$ ,  $CH_2(COOH)_2$ ,  $C_2H_4(COOH)_2$ ,  $C_3H_6(COOH)_2$ ,  $C_4H_8(COOH)_2$ ,  $C_5H_{10}(COOH)_2$ , fumaric acid, maleic acid, malonic acid, lactic acid, citric acid, tartaric acid, oxalic acid, ascorbic acid, benzoic acid, salicylic acid, phthalic acid, carbonic acid, formic acid,
- 20 methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, camphoric acid, gluconic acid, L-glutamic acid, D-glutamic acid, L-aspartic acid, D-aspartic acid, trifluoroacetic acid and ranelic acid.
12. A pharmaceutical composition according to any of items 9-11, wherein the acid is a
- 25 non-chelator of strontium.
13. A pharmaceutical composition according to any of items 9-12, wherein the salt is in hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or polymeric form.
- 30
14. A pharmaceutical composition according to any of items 9-13, wherein the salt is water soluble.
15. A pharmaceutical composition according to item 14, wherein the salt has a water
- 35 solubility of at least 1 g/l, such as, e.g., at least 5 g/l, at least 10 g/l, at least 20 g/l, at least 30 g/l, at least 40 g/l, at least 50 g/l, at least 60 g/l, at least 70 g/l, at least 80 g/l, at least 90 g/l or at least 100 g/l measured at a temperature of 25°C.

16. A pharmaceutical composition according to any of items 9-15, wherein the salt is selected from the group comprising strontium chloride, strontium chloride hexahydrate, strontium citrate, strontium malonate, strontium succinate, strontium fumarate, strontium ascorbate, strontium L-glutamate, strontium D-glutamate, strontium L-aspartate, strontium D-aspartate, strontium pyruvate, strontium tartrate, strontium glutarate, strontium maleate, strontium methanesulfonate, strontium benzenesulfonate and mixtures thereof.

17. A pharmaceutical composition according to any of items 9-16, wherein the acid is a monoprotic or a diprotic acid.

10

18. A pharmaceutical composition according to any of items 9-17, wherein the salt is selected from the group consisting of strontium bromide, strontium bromide hexahydrate, strontium acetate, strontium carbonate, strontium gluconate, strontium lactate, strontium ranelate and mixtures thereof.

15

19. A pharmaceutical composition according to any of items 6-18, further comprising an additional amount of an alpha-ketoglutarate-containing compound.

20. A pharmaceutical composition according to any of items 6-19, wherein the alpha-ketoglutarate-containing compound is a salt of an alkali metal, a mixed salt of alkali metals, an alkaline earth metal, or mixtures thereof.

21. A pharmaceutical composition according to item 20, wherein the salt is selected from the group consisting of sodium alpha-ketoglutarate, potassium alpha-ketoglutarate, lithium alpha-ketoglutarate, magnesium alpha-ketoglutarate, calcium alpha-ketoglutarate and mixtures thereof.

22. A pharmaceutical composition according to item 19, wherein the alpha-ketoglutarate-containing compound is a salt of an amine or an amino acid or an ammonium salt or mixtures thereof.

23. A pharmaceutical composition according to item 22, wherein the amine is selected from methyl amine, ethyl amine, propyl amine, isopropyl amine and butyl amine.

24. A pharmaceutical composition according to item 22, wherein the amino acid is selected from arginine, ornithine, lysine and histidine.

25. A pharmaceutical composition according to any of items 6-24, the composition further comprising one or more active substances.

26. A pharmaceutical composition according to item 25, wherein the one or more active substances has a therapeutic and/or prophylactic effect on a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain.

20

27. A pharmaceutical composition according to item 26, wherein the one or more active substances reduce the incidence of osteoporotic and/or non-osteoporotic bone fracture, increase bone density and/or improve healing of bone such as, e.g., anti-resorptive and/or anabolic agents.

25

28. A pharmaceutical composition according to item 26 or 27, wherein the one or more active substances are selected from the group consisting of calcium-alpha-ketoglutarate, calcium, calcium salts, vitamin D such as, e.g., vitamin D3 and/or functional equivalents of vitamin D3, glucagon-like peptide-2, glucagons-like peptide-2 releasing compositions, bisphosphonates, selective estrogen receptor modulators, calcitonin, parathyroid hormone, parathyroid hormone related peptide, glucosamine sulphate, glutamic acid and/or salts thereof, aspartate and/or salts thereof, proline, L-threonate, glutamine and hydroxyproline.

29. A method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as,

- e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof an amount of the salt according to any of items 1-3.
- 15 30. A method according to item 29, wherein the salt is administered in a dose corresponding to from about 0.1 to about 17 g daily calculated as anhydrous salt.
31. A method according to item 30, wherein the salt is administered in a dose corresponding to from about 0.2 to about 15 g daily such as, e.g., from about 0.4 to about 20 13 g daily, from about 0.6 to about 12 g daily or from about 0.7 to about 11.5 g daily calculated as anhydrous salt.
32. A method according to any of items 29-31, further comprising administration of an additional dose of a strontium-containing compound.
- 25 33. A method according to any of items 29-32, further comprising administration of an additional dose of an alpha-ketoglutarate-containing compound.
34. A method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics,
- 30 35

- osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof a therapeutic and/or prophylactic effective amount of a combination of one or more first components containing a strontium compound and one or more second components containing an alpha-ketoglutarate compound.
- 10 35. A method according to any of items 29-34, wherein the weight ratio between the total daily dose of strontium and the total daily dose of alpha-ketoglutarate is from about 0.01 to about 4, such as, e.g., from about 0.01 to about 4, from about 0.01 to about 2, from about 0.01 to about 1, from about 0.01 to about 0.6, from about 0.03 to about 4, from about 0.03 to about 2, from about 0.03 to about 1, from about 0.1 to about 2, from about 0.1 to about 1, from about 0.15 to about 0.5, from about 0.2 to about 2, from about 0.3 to about 2 or from about 0.4 to about 2.
- 15 36. A method according any of items 29-35, wherein the daily dose of strontium is at least about 0.01 g, such as, e.g. at least about 0.025 g, at least about 0.050 g, at least about 0.075 g, at least about 0.1 g, at least about 0.2 g, at least about 0.3 g, at least about 0.4 g or at least about 0.5 g or from about 0.01 g to about 2 g such as, e.g., from about 0.1 g to about 2 g, from about 0.3 g to about 2 g or from about 0.3 g to about 1 g.
- 25 37. A method according to any of items 29-36, wherein the daily dose of alpha-ketoglutarate is at least about 0.5 g, such as, e.g., at least about 1.0 g, at least about 1.5 g, at least about 2.0 g, at least about 2.5 g, at least about 3.0 g, at least about 4 g, at least about 5 g or from about 0.5 g to about 10 g, from about 0.5 g to 7 g, from about 2 g to about 10 g or from about 2 g to about 7 g.
- 30 38. A method according to any of items 29-37, wherein the strontium component and the alpha-ketoglutarate component are administered in the form of a pharmaceutical composition according to any of items 6-28.
- 35 39. A method according to any of items 29-38, wherein the administration takes place one or more times daily.

40. A method according to item 39, wherein the administration takes place from 2-5 times daily.
41. A method according to any of items 29-40, wherein the administration of the strontium component and the alpha-ketoglutarate component takes place simultaneously.
42. A method according to any of items 32-40, wherein the administration of the strontium component and the alpha-ketoglutarate component takes place sequentially.
43. A method according to any of items 29-42, wherein the subject is a mammal, such as, e.g. a human or a domestic animal, such as, e.g., a cat, a dog, a horse, a cow or a sheep.
44. A method according to any of items 29-43 further comprising administering a daily dose of vitamin D.
45. A method according to item 44, wherein the vitamin D is vitamin D<sub>3</sub>.
46. A method according to item 45, wherein the daily dose of vitamin D<sub>3</sub> is from about 5  $\mu$ g to about 30  $\mu$ g, such as, e.g., from about 10  $\mu$ g to about 20  $\mu$ g.
47. A method according to any of items 44-46, wherein the strontium component is administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, the alpha-ketoglutarate component is administered in a dose corresponding to a daily dose of from about 2 g to about 7 g and the dose of vitamin D<sub>3</sub> corresponds to a daily dose of from about 10  $\mu$ g to about 20  $\mu$ g.
48. A method according to any of items 44-47, wherein the administration of the strontium component, the alpha-ketoglutarate component and vitamin D takes place simultaneously.
49. A method according to any of items 44-48, wherein the administration of the strontium component, the alpha-ketoglutarate component and/or vitamin D takes place sequentially.
50. A method according to any of item 29-49 further comprising administering a daily dose of calcium.
51. A method according to item 50, wherein the daily dose of calcium is from about 0.5 g to about 2 g such as, e.g., from about 0.5 g to about 1.5 g, from 0.5 g to 1 g and from

about 1 g to about 1.5 g.

52. A method according to item 50 or 51, wherein the administration of the strontium component and calcium takes place simultaneously.

5

53. A method according to item 50 or 51, wherein the administration of the strontium component and calcium takes place sequentially.

54. A method according to any of items 50-53, wherein calcium is administered at least  
10 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of the strontium component.

55. A method according to any of items 50-53, wherein calcium is administered at least  
15 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of the strontium component.

56. A method according to any of items 50-54, wherein the strontium component and the  
20 alpha-ketoglutarate component are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of the strontium and the alpha-ketoglutarate component.

25 57. A method according to any of items 50-53, 55 wherein the strontium component and the alpha-ketoglutarate component are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of the strontium and the alpha-ketoglutarate component.

30

58. A method according to item 56 or 57, wherein the strontium component is administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, the alpha-ketoglutarate component is administered in a dose corresponding to a daily dose of from about 2 g to about 7 g and the dose of calcium corresponds to a daily dose of from  
35 about 0.5 g to about 1 g.

59. A method according to any of items 44-58, wherein the strontium component is administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, the

alpha-ketoglutarate component is administered in a dose corresponding to a daily dose of from about 2 g to about 7 g, vitamin D<sub>3</sub>, if present, is administered in a daily dose of from about 10 µg to about 20 µg, and the dose of calcium corresponds to a daily dose of from about 0.5 g to about 1 g.

5

60. A method according to any of items 44-59, wherein the administration of the strontium component, the alpha-ketoglutarate component, vitamin D and calcium takes place simultaneously.

10 61. A method according to any of items 44-59, wherein the administration of the strontium component, the alpha-ketoglutarate component, vitamin D and/or calcium takes place sequentially.

15 62. A method according to any of items 44-59, wherein the strontium component, the alpha-ketoglutarate component and vitamin D are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of the strontium and alpha-ketoglutarate component and vitamin D.

20

63. A method according to any of items 44-59, wherein the strontium component, the alpha-ketoglutarate component and vitamin D are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or  
25 at least 12 h before the administration of the strontium and alpha-ketoglutarate component and vitamin D.

64. A method according to any of items 29-63 further comprising administration of one or more further active substances, such as, e.g. glucagon-like peptide-2, glucagon-like  
30 peptide-2 releasing compositions, bisphosphonates, selective estrogen receptor modulators, calcitonin, parathyroid hormone, parathyroid hormone related peptide, glucosamine sulphate, glutamic acid and/or salts thereof, aspartate and/or salts thereof, proline, L-threonate, glucosamine sulphate, glutamine, asparagine and hydroxyproline.

35 65. A method according to item 64, wherein the further active substance is a parathyroid hormone or a fragment or analogue thereof or a parathyroid hormone related peptide or a fragment or analogue thereof.

66. A kit for use in treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g.,

5 osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities

10 due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the

15 maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising strontium alpha-ketoglutarate and one or more second components comprising at least one of the following: i) a further strontium containing compound, ii) a further alpha-ketoglutarate containing compound, iii) a calcium containing

20 compound, iv) vitamin D, v) parathyroid hormone, vi) a further active substance.

67. A kit for use in treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g.,

25 osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities

30 due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the

35 maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a

further strontium containing compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, and one or more second components comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a further strontium containing  
 5 compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, with the proviso that the first and the one or more second components are not identical.

68. A kit according to item 66 or 67 further comprising instructions for use of the individual  
 10 components.

69. Use of a strontium glutamate salt of the formula II

15

as a medicine.

70. Use of a salt according to item 69 for the preparation of a pharmaceutical composition for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions  
 20 resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarthritic erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant  
 25 hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or  
 30 osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain.

35 71. Use of a salt according to item 69 or 70, wherein the pharmaceutical composition comprises an amount of the strontium glutamate salt, together with one or more physiologically acceptable excipients.

72. Use of a salt according to any of items 69-71, wherein the pharmaceutical composition further comprises an additional amount of a strontium-containing compound.
- 5 73. Use of a salt according to item 72, wherein the strontium-containing compound is selected from the group consisting of strontium salts of an organic or an inorganic acid.
74. Use of a salt according to item 73, wherein the inorganic acid is selected from the group consisting of hydrofluoric acid, hydrochloric acid, hydrobromic acid, hydroiodic acid,  
10 nitric acid, nitrous acid, phosphoric acid, phosphinic acid, phosphonic acid, sulfonic acid, sulfuric acid, sulfurous acid, disulfuric acid and boric acid.
75. Use of a salt according to item 73, wherein the organic acid is selected from the group consisting of acetic acid,  $C_2H_5COOH$ ,  $C_3H_7COOH$ ,  $C_4H_9COOH$ ,  $(COOH)_2$ ,  $CH_2(COOH)_2$ ,  
15  $C_2H_4(COOH)_2$ ,  $C_3H_6(COOH)_2$ ,  $C_4H_8(COOH)_2$ ,  $C_6H_{10}(COOH)_2$ , fumaric acid, maleic acid, malonic acid, lactic acid, citric acid, tartaric acid, oxalic acid, ascorbic acid, benzoic acid, salicylic acid, phthalic acid, carbonic acid, formic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, camphoric acid, gluconic acid, L-threonate, glucosamine sulphate, L-glutamic acid, D-glutamic acid, L-aspartic acid, D-aspartic acid,  
20 trifluoroacetic acid and ranelic acid.
76. Use of a salt according to any of items 73-75, wherein the acid is a non-chelator of strontium.
- 25 77. Use of a salt according to any of items 73-76, wherein the salt is in hydrate, anhydrous, solvate, polymorphous, amorphous, crystalline, microcrystalline or polymeric form.
78. Use of a salt according to any of items 73-77, wherein the salt is water soluble.  
30
79. Use of a salt according to item 78, wherein the salt has a water solubility of at least 1 g/l, such as, e.g., at least 5 g/l, at least 10 g/l, at least 20 g/l, at least 30 g/l, at least 40 g/l, at least 50 g/l, at least 60 g/l, at least 70 g/l, at least 80 g/l, at least 90 g/l or at least 100 g/l measured at a temperature of 25°C.  
35
80. Use of a salt according to any of items 73-79, wherein the salt is selected from the group comprising strontium chloride, strontium chloride hexahydrate, strontium citrate,

strontium malonate, strontium succinate, strontium fumarate, strontium ascorbate, strontium L-glutamate, strontium D-glutamate, strontium L-aspartate, strontium D-aspartate, strontium pyruvate, strontium tartrate, strontium glutarate, strontium maleate, strontium methanesulfonate, strontium L-threonate, strontium benzenesulfonate and  
5 mixtures thereof.

81. Use of a salt according to any of items 73-80, wherein the acid is a monoprotic or a diprotic acid.

10 82. Use of a salt according to any of items 73-81, wherein the salt is selected from the group consisting of strontium bromide, strontium bromide hexahydrate, strontium acetate, strontium carbonate, strontium gluconate, strontium lactate, strontium ranelate and mixtures thereof.

15 83. Use of a salt according to any of items 69-82, further comprising an additional amount of a glutamate-containing compound.

84. Use of a salt according to item 83, wherein the glutamate-containing compound is a salt of an alkali metal or an alkaline earth metal, or mixtures thereof.

20

85. Use of a salt according to item 84, wherein the salt is selected from the group consisting of sodium glutamate, potassium glutamate, lithium glutamate, magnesium glutamate, calcium glutamate and mixtures thereof.

25 86. Use of a salt according to item 85, wherein the glutamate-containing compound is a salt of an amine or an amino acid or an ammonium salt or mixtures thereof.

87. Use of a salt according to item 86, wherein the amine is selected from methyl amine, ethyl amine, propyl amine, isopropyl amine and butyl amine.

30

88. Use of a salt according to item 86, wherein the amino acid is selected from arginine, ornithine, lysine and histidine.

89. Use of a salt according to any of items 69-88, wherein the composition further  
35 comprises one or more active substances.

90. Use of a salt according to item 89, wherein the one or more active substances has a

therapeutic and/or prophylactic effect on a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain.

91. Use of a salt according to item 90, wherein the one or more active substances reduce the incidence of bone fracture, increase bone density and/or improve healing of bone such as, e.g., anti-resorptive and/or anabolic agents.

20

92. Use of a salt according to item 90 or 91, wherein the one or more active substances are selected from the group consisting of calcium-alpha-ketoglutarate, calcium, calcium salts, vitamin D, such as, e.g., vitamin D3 and/or functional equivalents of vitamin D3, glucagon-like peptide-2, glucagon-like peptide-2 releasing compositions, bisphosphonates, selective estrogen receptor modulators, calcitonin, parathyroid hormone, parathyroid hormone related peptide, glucosamine sulphate, glutamic acid and/or salts thereof, aspartate and/or salts thereof, proline, L-threonate, glucosamine sulphate, glutamine, asparagine and hydroxyproline.

93. A method for the treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to

- steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for
- 5 the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof an amount of a strontium glutamate salt.
- 10 94. A method according to item 93, wherein the salt is administered in a dose corresponding to from about 0.2 to about 28 g daily calculated as anhydrous salt.
95. A method according to item 93, wherein the salt is administered in a dose corresponding to from about 0.3 to about 25 g daily such as, e.g., from about 0.7 to about
- 15 20 g daily, from about 1 to about 17 g daily, from about 1.2 to about 16 g daily or from about 2 to about 6 g daily calculated as anhydrous salt.
96. A method according to any of items 93-95, further comprising administration of an additional dose of a strontium-containing compound.
- 20 97. A method according to any of items 93-96, further comprising administration of an additional dose of a glutamate-containing compound.
98. A method for the treatment and/or prophylaxis of a cartilage and/or bone disease
- 25 and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease,
- 30 malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or
- 35 osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues

and for weight gain, the method comprising administering to a subject in need thereof a therapeutic and/or prophylactic effective amount of a combination of one or more first components containing a strontium compound and one or more second components containing a glutamate compound.

5

99. A method according to any of items 93-98, wherein the weight ratio between the total daily dose of strontium and the total daily dose of glutamate is from about 0.01 to about 4, such as, e.g., from about 0.01 to about 4, from about 0.01 to about 2, from about 0.01 to about 1, from about 0.01 to about 0.6, from about 0.03 to about 4, from about 0.03 to about 2, from about 0.03 to about 1, from about 0.1 to about 2, from about 0.1 to about 1, from about 0.15 to about 0.5, from about 0.2 to about 2, from about 0.3 to about 2 or from about 0.4 to about 2.

100. A method according to any of items 93-99, wherein the daily dose of strontium is at least about 0.01 g, such as, e.g. at least about 0.025 g, at least about 0.050 g, at least about 0.075 g, at least about 0.1 g, at least about 0.2 g, at least about 0.3 g, at least about 0.4 g or at least about 0.5 g or from about 0.01 to about 2 g such as, e.g., from about 0.1 to about 2 g, from about 0.3 to about 2 g or from about 0.3 to about 1 g.

101. A method according to any of items 93-100, wherein the daily dose of glutamate is at least about 0.5 g, such as, e.g., at least about 1.0 g, at least about 1.5 g, at least about 2.0 g, at least about 2.5 g, at least about 3.0 g, at least about 4 g, at least about 5 g or from about 0.5 to about 10 g, from about 0.5 to 7 g, from about 2 to about 10 g or from about 2 to about 7 g.

25

102. A method according to any of items 93-100, wherein the strontium component and the glutamate component are administered in the form of a pharmaceutical composition.

103. A method according to any of items 93-101, wherein the administration takes place one or more times daily.

30

104. A method according to item 103, wherein the administration takes place from 2 to 5 times daily.

105. A method according to any of items 93-104, wherein the administration of the strontium component and the glutamate component takes place simultaneously.

35

106. A method according to any of items 96-104, wherein the administration of the

strontium component and the glutamate component takes place sequentially.

107. A method according to any of items 96-106, wherein the subject is a mammal, such as, e.g. a human or a domestic animal, such as, e.g., a cat, a dog, a horse, a cow or a  
5 sheep.

108. A method according to any of items 93-107 further comprising administering a daily dose of vitamin D.

10 109. A method according to item 108, wherein the vitamin D is vitamin D<sub>3</sub>.

110. A method according to item 109, wherein the daily dose of vitamin D<sub>3</sub> is from about 5  $\mu$ g to about 30  $\mu$ g, such as, e.g., from about 10  $\mu$ g to about 20  $\mu$ g.

15 111. A method according to any of items 108-110, wherein the daily dose of strontium is from about 0.3 g to about 1 g, the daily dose of glutamate is from about 2 g to about 7 g and the daily dose of vitamin D<sub>3</sub> is from about 10  $\mu$ g to about 20  $\mu$ g.

112. A method according to any of items 108-110, wherein the administration of strontium,  
20 glutamate and vitamin D takes place simultaneously.

113. A method according to any of items 108-110, wherein the administration of strontium, glutamate and/or vitamin D takes place sequentially.

25 114. A method according to any of item 93-113 further comprising administering a daily dose of calcium.

115. A method according to item 114, wherein the daily dose of calcium is from about 0.5 to about 2 g such as, e.g., from about 0.5 to about 1.5 g, from about 0.5 to about 1 g, or  
30 from about 1 g to about 1.5 g.

116. A method according to item 114 or 115, wherein the administration of the strontium component and calcium takes place simultaneously.

35 117. A method according to item 114 or 115, wherein the administration of the strontium component and calcium takes place sequentially.

118. A method according to any of items 114-117, wherein calcium is administered at

least 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of the strontium component.

5 119. A method according to any of items 114-117, wherein calcium is administered at least 0.5 h, such as, e.g., at least 1 h, at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of the strontium component.

10 120. A method according to any of items 114-118, wherein strontium and glutamate are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of strontium and glutamate.

15

121. A method according to any of items 114-117, 119 wherein strontium and glutamate are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of strontium

20 and glutamate.

122. A method according to item 120 or 121, wherein strontium is administered in a dose corresponding to a daily dose of from about 0.3 to about 1 g, glutamate is administered in a dose corresponding to a daily dose of from about 2 to about 7 g and the dose of calcium

25 corresponds to a daily dose of from about 0.5 to 1 g.

123. A method according to any of items 108-122, wherein strontium is administered in a dose corresponding to a daily dose of from about 0.3 g to about 1 g, glutamate is administered in a dose corresponding to a daily dose of from about 2 g to about 7 g,

30 vitamin D<sub>3</sub>, if present, is administered in a daily dose of from about 10 µg to about 20 µg, and the dose of calcium corresponds to a daily dose of from about 0.5 g to about 1 g.

35

124. A method according to any of items 108-123, wherein the administration of strontium, glutamate, vitamin D and calcium takes place simultaneously.

125. A method according to any of items 108-123, wherein the administration of strontium, glutamate, vitamin D and/or calcium takes place sequentially.

126. A method according to any of items 108-123, wherein strontium, glutamate and vitamin D are administered simultaneously and calcium are administered at least 1 h, such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at  
5 least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h after the administration of strontium and glutamate and vitamin D.

127. A method according to any of items 108-123, wherein strontium, glutamate and vitamin D are administered simultaneously and calcium are administered at least 1 h,  
10 such as, e.g., at least 2 h, at least 3 h, at least 4 h, at least 5 h, at least 6 h, at least 7 h, at least 8 h, at least 9 h, at least 10 h, at least 11 h or at least 12 h before the administration of strontium, glutamate and vitamin D.

128. A method according to any of items 93-126 further comprising administration of a  
15 further active substance, such as, e.g. glucagon-like peptide-2, glucagon-like peptide-2 releasing compositions, bisphosphonates, selective estrogen receptor modulators, calcitonin, parathyroid hormone, parathyroid hormone related peptide, glutamic acid and/or salts thereof, proline, L-threonate, glucosamine sulphate, glutamine and hydroxyproline.

20

129. A method according to item 128, wherein the further active substance is a parathyroid hormone or a fragment or analogue thereof or a parathyroid hormone related peptide or a fragment or analogue thereof.

25 130. A kit for use in treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in  
30 rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-  
35 induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the

maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising strontium glutamate and one or more second components comprising at least one of the following: i) a further strontium containing compound, ii) a further glutamate containing compound, iii) a calcium containing compound, iv) vitamin D, v) parathyroid hormone, vi) a further active substance.

131. A kit for use in treatment and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarthritic erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the kit comprising at least a first and a second component, the first component comprising at least one of the following: i) strontium alpha-ketoglutarate, ii) a further strontium containing compound, iii) a further alpha-ketoglutarate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, and one or more second components comprising at least one of the following: i) strontium glutamate, ii) a further strontium containing compound, iii) a further glutamate containing compound, iv) a calcium containing compound, v) vitamin D, vi) parathyroid hormone, vii) a further active substance, with the proviso that the first and the one or more second components are not identical.

132. A kit according to item 130 or 131 further comprising instructions for use of the individual components.

133. A pharmaceutical composition according to any of items 6-28 in the form of a tablet.

134. A pharmaceutical composition according to item 133, wherein the tablet is coated

with a coating that enables release of at least part of the salt in the proximal part of the small intestine, such as e.g. the duodenum and/or the proximal jejunum such as at least 50% w/w, at least 60% w/w, at least 65% w/w, at least 70% w/w, at least 80% w/w or at least 90% w/w of the total amount of the salt contained in the tablet.

5

135. A pharmaceutical composition according to item 133 or 134, wherein the tablet has a shape that makes it easy and convenient for a patient to swallow.

136. A pharmaceutical composition according to item 135, wherein the tablet has a  
10 rounded or a rod-like shape, without any sharp edges.

137. A pharmaceutical composition according to any of items 133-136, wherein the tablet is designed to be divided in two or more parts.

**Claims**

1. Use of a strontium salt having a water-solubility at room temperature in a range of from about 1 g/l to about 100 g/l in medicine.
- 5 2. Use according to claim 1, wherein the strontium salt is formed between strontium and an organic or inorganic acid.
3. Use according to claim 2, wherein the organic acid is a mono-, di-, tri- or quato-  
carboxylic acid.
- 10 4. Use according to claim 2 or 3, wherein the organic acid is an amino carboxylic acid.
5. Use according to claim 4, wherein the amino carboxylic acid has a linear or branched carbon chain of from 2 to 25 carbon atoms and one or more amino groups attached  
15 thereto.
6. Use according to claims 3-5, wherein the amino carboxylic acid is a natural or synthetic amino acid.
- 20 7. Use according to any of the preceding claims, wherein the salt is selected from the group consisting of strontium glutamate, strontium aspartate, strontium malonate, strontium maleate, strontium ascorbate, strontium threonate, strontium lactate, strontium pyruvate, strontium alpha-ketoglutarate and strontium succinate.
- 25 8. Use according to claim 7, wherein the salt is selected from the group consisting of strontium D-glutamate, strontium L-glutamate, strontium D-aspartate, strontium L-aspartate, strontium D-threonate and strontium L-threonate.
9. Use of a strontium salt having a water-solubility at room temperature in a range of from  
30 about 1 g/l to about 100 g/l for the preparation of a pharmaceutical composition for the treatment of and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of  
35 malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due to bone

- metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or
- 5 osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain.
- 10 10. Use according to claim 9, wherein the strontium salt is as defined in any of claims 1-8.
11. Use according to claim 9 or 10, wherein the pharmaceutical composition is designed for oral or parenteral administration.
- 15 12. Use according to claim 11, wherein the pharmaceutical composition is in the form of tablets, capsules, sachets, powders, pellets, granules, granulates, mixtures, syrups, solutions, suspensions, emulsions, or the like, for oral administration.
13. Use according to claim 11, wherein the pharmaceutical composition is in the form of a
- 20 solution, suspension or emulsion, or the like, for intravenous, intramuscular, intraarticular or subcutaneous injection.
14. Use according to claim 11, wherein the pharmaceutical composition is in the form of a toothpaste or a mouthwash intended for application to the teeth or to the oral mucosa.
- 25 15. A strontium salt having a water-solubility at room temperature in a range of from about 1 g/l to about 100 g/l with the proviso that the salt is not strontium L-aspartate trihydrate or strontium L-glutamate hexahydrate as defined by the properties disclosed in figures 1- 3 and tables 2 - 5.
- 30 16. A strontium salt according to claim 15, wherein the salt is formed between strontium and an organic or inorganic acid.
17. A strontium salt according to claim 16, wherein the organic acid is a mono-, di-, tri- or
- 35 quatro-carboxylic acid.
18. A strontium salt according to claim 16 or 17, wherein the organic acid is an amino

carboxylic acid.

19. A strontium salt according to claim 17, wherein the amino carboxylic acid has a linear or branched carbon chain of from 2 to 25 carbon atoms and one or more amino groups  
5 attached thereto.

20. A strontium salt according to claims 17-19, wherein the amino carboxylic acid is a natural or synthetic amino acid.

10 21. A strontium salt according to any of claims 15-20, wherein the salt is selected from the group consisting of strontium glutamate, strontium aspartate, strontium malonate, strontium maleate, strontium ascorbate, strontium threonate, strontium lactate, strontium pyruvate, strontium alpha-ketoglutarate and strontium succinate.

15 22. A strontium salt according to claim 21, wherein the salt is selected from the group consisting of strontium D-glutamate, strontium D-aspartate, strontium D-threonate and strontium L-threonate.

20 23. A strontium salt according to any of claims 15-21, which is strontium L-glutamate prepared by reacting strontium chloride with L-glutamic acid as described in example 4 and having the X-ray diffraction pattern as shown herein.

24. A method for the treatment of and/or prophylaxis of a cartilage and/or bone disease and/or conditions resulting in a dysregulation of cartilage and/or bone metabolism in a  
25 mammal, such as, e.g., a human female or male adult, adolescent or a child, such as, e.g., osteoporosis, osteoarthritis, osteopetrosis, osteopenia and Paget's disease, hypercalcemia of malignancy, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, osteodystrophy, myositis ossificans, Bechterew's disease, malignant hypercalcemia, osteolytic lesions produced by bone metastasis, bone pain due  
30 to bone metastasis, bone loss due to sex steroid hormone deficiency, bone abnormalities due to steroid hormone treatment, bone abnormalities caused by cancer therapeutics, osteomalacia, Bechet's disease, hyperostosis, metastatic bone disease, immobilization-induced osteopenia or osteoporosis, or glucocorticoid-induced osteopenia or  
osteoporosis, osteoporosis pseudoglioma syndrome, idiopathic juvenile osteoporosis, for  
35 the improvement of fracture healing after traumatic or atraumatic fracture, and for the maintenance or increase of energy level, for building up or strengthening muscle tissues and for weight gain, the method comprising administering to a subject in need thereof an

effective amount of a strontium salt that has a water-solubility of from about 1 g/l to about 100 g/l at room temperature.

25. A method according to claim 24, wherein the strontium salt is as defined in any of  
5 claims 1-23.

26. A method according to claim 24 or 25, wherein the daily dose of ionic strontium is at  
least about 0.01 g, such as, e.g. at least about 0.025 g, at least about 0.050 g, at least  
about 0.075 g, at least about 0.1 g, at least about 0.2 g, at least about 0.3 g, at least about  
10 0.4 g or at least about 0.5 g or from about 0.01 g to about 2 g such as, e.g., from about  
0.1 g to about 2 g, from about 0.3 g to about 2 g or from about 0.3 g to about 1 g.

27. A method according to any of claims 24-26, wherein the administration takes place  
one or more times daily.

15

28. A method according to claim 27, wherein the administration takes place from 2-5 times  
daily.

29. A method according to any of claims 24-28, wherein the administration takes place at  
20 bedtime.

30. A method according to any of claims 24-29, wherein the peak concentration of  
strontium after oral administration is delayed compared to that of strontium chloride.

25 31. A method according to any of claims 24-30, wherein the peak concentration of  
strontium is reached at least 2.5 hours after oral administration.

32. A pharmaceutical composition comprising a strontium salt having a water-solubility  
from about 1 g/l to about 100 g/l at room temperature together with one or more  
30 pharmaceutically acceptable excipients.

33. A pharmaceutical composition according to claim 40, wherein the strontium salt is as  
defined in claims 1-23.

35 34. A pharmaceutical composition according to claim 32 or 33, wherein the  
pharmaceutical composition is as defined in any of claims 11-14.

35. A method for the preparation of a strontium salt having a water-solubility of from about 1 g/l to about 100 g/l at room temperature, the method comprising reacting strontium hydroxide with the appropriate acid (anion) in an aqueous medium at a temperature of about 100 °C or more such as, e.g., about 120 °C or more, or about 125 °C or more for a  
5 time period of at the most about 60 min such as, e.g. at the most about 30 min or at the most about 20 min such as about 15 min.

36. A method according to claim 35, wherein the molar ratio between strontium hydroxide and the organic anion is at least 1:1, preferably above 1.1:1.
